Central Dogma of Molecular Biology

The DNA is the building block of life. It contains all the information and instructions needed in order for the living cells to function. One of its main function is to direct the production of proteins, the working molecules, which in turn work to carry out the necessary biological functions. The information for making proteins is stored in sections of the DNA called genes. For this reason DNA is also referred to as the genetic material and the process of converting the information from these genes into protein is called gene expression. Despite the observable and obvious differences in plants, animals, and microbes, the mechanism by which they all accomplish gene expression is generally the same.

Information flows from DNA to RNA to Proteins

Information flows from DNA to RNA to proteins.

We previously know that the DNA is composed of four basic units namely: thymine, cytosine, adenine, and guanine. The first step of gene expression, this DNA is copied in similar but slightly different form of genetic material called RNA. The difference between the DNA and RNA lies in one of the bases, thymine, which is replaced by uracil in RNA. Furthermore, DNA is double stranded while RNA is single stranded. However, before the information is transcribed into RNA the DNA will undergo replication process. The complementary strand from the replicated DNA (3'-5') will be the template to copy the information from the DNA to RNA and proceed the
