Chemicals in Medicine

Chemical substances used for the treatment of diseases and to reduce the suffering from pain are called **medicines** or **drugs**. A medicine is a chemical substance that cures the disease and is not only safe to use but also not cause any addiction or much toxicity while a drug cures disease and may cause side effects and creates addiction etc. e.g., Penicillin is a medicine while Heroin is a drug.

Drug — Target interaction

- Proteins which act as biological catalysts in the body are called enzymes.
- Proteins which are crucial to communication system in the body are called receptors.
- Proteins which carry polar molecules across the membranes are called carrier proteins.

(1) Enzymes as Drug Targets

(i) Catalytic action of enzymes

- The substrate molecules bind to the amino acid residues of the protein present on the active site of the enzyme through a variety of interactions such as hydrogen bonding, dipole-dipole interactions, van der Waals interactions and ionic bonding. These binding forces should be strong enough to hold the substrate long enough so that the enzyme can catalyse the reaction, but weak enough to allow the products to depart after their formation.

Definitions

A medicine is a chemical substance which cures the disease, is safe to use, has negligible toxicity and drug is a chemical substance which also cures the disease but is habit forming, causes addiction and has serious side effects.

Concept Ladder

The drugs in our body can be administered by oral, intravenous injections which is determined by the physical and chemical properties and the site of desired action.

The Chemistry of Life's Origins J Mayo Greenberg, C X Mendoza-Gomez, Valerio Pirronello, 1993-10-31 **Lectures on the Chemistry of Life** Thomas Turner, Frederick Crace Calvert, 1847 What is Life? Addy Pross, 2012-09-27 Seventy years ago Erwin Schrödinger posed a profound question What is life and how did it emerge from non life This problem has puzzled biologists and physical scientists ever since Living things are hugely complex and have unique properties such as self maintenance and apparently purposeful behaviour which we do not see in inert matter So how does chemistry give rise to biology What could have led the first replicating molecules up such a path Now developments in the emerging field of systems chemistry are unlocking the problem Addy Pross shows how the different kind of stability that operates among replicating molecules results in a tendency for chemical systems to become more complex and acquire the properties of life Strikingly he demonstrates that Darwinian evolution is the biological expression of a deeper well defined chemical concept the whole story from replicating molecules to complex life is one continuous process governed by an underlying physical principle The gulf between biology and the physical sciences is finally becoming bridged This new edition includes an Epilogue describing developments in the concepts of fundamental forms of stability discussed in the book and their profound implications Oxford Landmark Science books are must read classics of modern science writing which have crystallized big ideas and shaped the way we think **The Tao of Chemistry and Life** Eugene H.
