Urban Engineering for Sustainability Sybil Derrible, 2019-11-19 A textbook that introduces integrated sustainable design of urban infrastructures drawing on civil engineering, environmental engineering, urban planning, electrical engineering, mechanical engineering, and computer science. This textbook introduces urban infrastructure from an engineering perspective with an emphasis on sustainability. Bringing together both fundamental principles and practical knowledge from civil engineering, environmental engineering, urban planning, electrical engineering, mechanical engineering, and computer science, the book transcends disciplinary boundaries by viewing urban infrastructures as integrated networks. The text devotes a chapter to each of five engineering systems: electricity, water, transportation, buildings, and solid waste, covering such topics as fundamentals, demand management, technology, and analytical models. Other chapters present a formal definition of sustainability, discuss population forecasting techniques, offer a history of urban planning from the Neolithic era to Kevin Lynch and Jane Jacobs, define and discuss urban metabolism and infrastructure integration, reviewing system interdependencies and describe approaches to urban design that draw on complexity theory, algorithmic models, and machine learning. Throughout, a hypothetical city state, Civitas, is used to explain and illustrate the concepts covered. Each chapter includes working examples and problem sets. An appendix offers tables, diagrams, and conversion factors. The book can be used in advanced undergraduate and graduate courses in civil engineering and as a reference for practitioners. It can also be helpful in preparation for the Fundamentals of Engineering (FE) and Principles and Practice of Engineering (PE) exams.

Transport, Mobility, and the Production of Urban Space Julie Cidell, David Prytherch, 2015-05-01 The contemporary urban experience is defined by flow and structured by circulating people, objects, and energy. Geographers have long provided key insights into transportation systems. But today concerns for social justice and sustainability motivate new critical approaches to mobilities. Reimagining the city prompts an important question: How best to rethink urban geographies of transport and mobility? This original book explores connections in theory and practice between transport geographies and new mobilities in the production of urban space. It provides a broad introduction to intersecting perspectives of urban geography, transport geography, and mobilities studies on urban places of flows. Diverse international and leading edge contributions reinterpret everyday intersections as nodes, urban corridors as links, cities and regions as networks, and the discourses and imaginaries that frame the politics and experiences of mobility. The chapters illuminate nearly all aspects of urban transport from street regulation and roadway planning, intended and

subversive practices of car and truck drivers planning and promotion of mass transit investments and the restructuring of freight and logistics networks Together these offer a unique and important contribution for social scientists planners and others interested in the politics of the city on the move *Environmental Footprints of Recycled Products* Subramanian Senthilkannan Muthu,2022-02-06 Recycling is the need of the hour and it is an inevitable destination at the end of the life of any product Today recycling can happen at postindustrial and post consumer states and the importance of recycled products in the market has gained significant importance Recycled products dominate the array of sustainable products in today s context Even though there are commercial implications for recycling one of the very important and obvious reasons to go for recycling and to have recycled products is to have the benefits on environmental sustainability It is highly important to assess the environmental footprints of recycled products and further improve the environmental benefits of such recycled products This book presents five interesting chapters pertaining to the environmental footprints of various recycled products

Interurban Road Charging for Trucks in Europe Jose Viegas,2005-01-19 Charging for the use of transport infrastructure has very different traditions in the various modes reflecting the different nature of their infrastructure nodal vs linear but also different historical traditions of open access system integration etc Since the early 90 s various European Commission initiatives took on this issue looking mainly at the road sector where many countries had no direct access charges Heavy goods vehicles were systematically identified as the primary targets for a renewed approach to this problem What seemed an easy catch has proved to be much harder with the various countries adopting almost exclusively national approaches and the European institutions unable to drive the process This book looks at the challenges posed by this objective recognising that there are multiple objectives for application of road tolls and charges and discussing the various possible solutions in the technical institutional and legal dimensions The multiplicity of national situations in Europe is put in perspective the impacts of various charging schemes on regional development and on the environment are estimated and the recent policy process is analysed allowing a global view of the remaining difficulties and to make recommendations about the next steps in the process
