Questions taken from Layelle-Jones: Churchill's Mastery of Medicine Surgery 1.

Question 1. The following are contraindications to major elective surgery requiring general anaesthesia:

- a. A myocardial infarction 12 months ago (False)
- b. A preoperative serum potassium of 2.6 mmol/litre in a patient on diuretic therapy (True)

Explanation: The normal serum potassium ranges from 3.5–5.5 mmol/litre. This patient is hypokalaemic (2.6 mmol/litre) and is at risk of cardiac arrhythmia if anaesthesia is induced. The hypokalaemia should be corrected by slow intravenous potassium infusion over 24–48 hours before proceeding to surgery.

- c. Previous mitral valve replacement (False)
- d. A resolving upper respiratory tract infection (True)

Explanation: Patients with evidence of an upper respiratory infection preoperatively who undergo surgery are at risk of developing major respiratory postoperative complications. Elective surgery should be deferred until any infection is completely resolved.

- e. Unsuspected glycosuria on routine ward urine testing (True)

Explanation: This may be the first indication of diabetes in an asymptomatic patient. Surgery tends to elevate blood glucose levels and may precipitate a diabetic coma in a previously undiagnosed diabetic. If unsuspected glycosuria is detected surgery should be deferred until the diagnosis of diabetes has been confirmed or excluded.
