<sup>1</sup> Minimum level of hydroxide alkalinity in boilers below 1000 psi must be individually specified with regard to silica solubility and other components of internal treatment. <sup>2</sup> Maximum total alkalinity consistent with acceptable steam purity. If necessary, the limitation on total alkalinity should override conductance as the control parameter. If make-up is demineralized water at 600-1000 psig, boiler water alkalinity and conductance should be as shown in the table for the 1001-1500 psig range. <sup>3</sup> NS (Not specified) in these cases refers to free sodium- or potassium-hydroxide alkalinity. Some small variable amount of total alkalinity will be present and measurable with the assumed congruent control or volatile treatment employed at these high pressure ranges. <sup>4</sup> None detectable.
