Safety and Reliability Assessment of Managed Pressure Drilling in Well Control Operations Idris Olusola Sule, 2019 Managed pressure drilling MPD is a technique utilized in drilling to manage annular pressure hold reservoir influx and divert mud returns away safely from the rig floor through a closed loop system Thus MPD plays key roles in well control operations and in drilling deepwater wells However despite the operational safety and economic benefits limited information is available on understanding the complexity of MPD system Furthermore the oil and gas industry currently relies on a flow monitoring system for earlier kick detection but faces severe flaws and limited progress has been made on approach that monitors kick from downhole due to the complexity of offshore drilling operations Thus the main objective of this research is to assess the safety and reliability of MPD In this research following novel contributions have been made several dynamic downhole drilling parameters have been identified to enhance earlier kick detection technique during drilling including about 33 89% damping of bit rock vibrations due to gas kick a reliability assessment model has been developed to estimate the failure probability of an MPD system as 5 74% the assess the increase in reliability of kick control operation increases from 94% to 97% due to structural modification of the MPD components

Real Time Kick Estimation and Monitoring in Managed Pressure Drilling System M. Musab Habib,2020 The influx of reservoir fluid kick has a significant impact on drilling operations Unmitigated kick can lead to a blowout causing financial losses and impacting human lives on the rig Kick is an unmeasured disturbance in the system and so detection estimation and mitigation are essential for the safety and efficiency of the drilling operation Our main objective is to develop a real time warning system for a managed pressure drilling MPD system In the first part of the research an unscented Kalman filter UKF based estimator was implemented to simultaneously estimate the bit flow rate and kick The estimated kick is further used to predict the impact of the kick Optimal control theory is used to calculate the time to mitigate the kick in the best case scenario An alarm system is developed based on total predicted influx and pressure rise in the system and compared with actual well operation control matrix Thus the proposed method can estimate monitor and manage kick in real time enhancing the safety and efficiency of the MPD operation So a robust warning framework for the operators based on real life operational conditions is created in the second part of the research Proposed frameworks are successfully validated by applying to several case studies

Nonlinear Model Predictive Control for a Managed Pressure Drilling with High-fidelity Drilling Simulators Junho Park, 2018

The world's energy demand has been rapidly increasing and is projected to continue growing for at least the next two decades. With increasing global energy demand and competition from renewable energy, the oil and gas industry is striving for more efficient petroleum production. Many technical breakthroughs have enabled the drilling industry to expand the exploration to more difficult drilling, such as deepwater drilling and multilateral directional drilling. For example, managed pressure drilling (MPD) offers ceaseless operation with multiple manipulated variables (MV) and wired drill pipe (WDP) provides two-way high-speed measurements from bottom hole and along string sensors. These technologies have maximum benefit when applied in an automation system or as a real-time advisory tool. The objective of this study is to investigate the benefit of nonlinear model-based control and estimation algorithms with various types of models. This work presents a new simplified flow model (SFM) for bottomhole pressure (BHP) regulation in MPD operations. The SFM is embedded into model-based control and estimation algorithms that use model predictive control (MPC) and moving horizon estimation (MHE) respectively. This work also presents a new Hammerstein-Wiener nonlinear model predictive controller for BHP regulation. Hammerstein-Wiener models employ input and output static nonlinear blocks before and after linear dynamics blocks to simplify the controller design. The control performance of the new Hammerstein-Wiener nonlinear controller is superior to conventional PID controllers in a variety of drilling scenarios. Conventional controllers show severe limitations in MPD because of the interconnected multivariable and nonlinear nature of drilling operations. BHP control performance is evaluated in scenarios such as drilling pipe connection, kick attenuation, and mud density displacement, and the efficacy of the SFM and Hammerstein-Wiener models is tested in various control schemes applicable to both WDP and mud pulse systems. Trusted high-fidelity drilling simulators are used to simulate well conditions and are used to evaluate the performance of the controllers using the SFM and Hammerstein-Wiener models. The comparison between non-WDP semi-closed loop and WDP full-closed loop applications validates the accuracy of the SFM under the set of conditions tested and confirms comparability with model-based control and estimation algorithms. The SFM-MPC maintains the BHP within 1 bar of the setpoint for each investigated scenario, including for pipe connection and mud density displacement procedures that experience a wider operation range than normal drilling.

Advanced Control of Managed Pressure Drilling Anirudh Nandan, 2016 Automation of managed pressure drilling MPD enhances the safety and increases efficiency of drilling and that drives the development of controllers and observers for MPD The objective is to maintain the bottom hole pressure BHP within the pressure window formed by the reservoir pressure and fracture pressure and also to reject kicks Practical MPD automation solutions must address the nonlinearities and uncertainties caused by the variations in mud flow rate choke opening friction factor mud density etc It is also desired that if pressure constraints are violated the controller must take appropriate actions to reject the ensuing kick The objectives are addressed by developing two controllers a gain switching robust controller and a nonlinear model predictive controller NMPC The robust gain switching controller is designed using H1 loop shaping technique which was implemented using high gain bumpless transfer and 2D look up table Six candidate controllers were designed in such a way they preserve robustness and performance for different choke openings and flow rates It is demonstrated that uniform performance is maintained under different operating conditions and the controllers are able to reject kicks using pressure control and maintain BHP during drill pipe extension The NMPC was designed to regulate the BHP and contain the outlet flow rate within certain tunable threshold The important feature of that controller is that it can reject kicks without requiring any switching and thus there is no scope for shattering due to switching between pressure and flow control That is achieved by exploiting the constraint handling capability of NMPC

Active set method was used for computing control inputs It is demonstrated that NMPC is able to contain kicks and maintain BHP during drill pipe extension Egentlige Relation aff Londen, om den Kongelig Croning Caroli II. som skeede den 26.
