Data Analyst Interview Questions and Answers - English Navneet Singh, Preparing for a data analyst interview requires a combination of technical knowledge analytical thinking and communication skills Here are some common interview questions along with model answers to help you get ready

Technical Questions What is the difference between a database and a data warehouse
Answer A database is designed to efficiently handle transactions and store real time data typically structured to support CRUD operations Create Read Update Delete A data warehouse on the other hand is designed for analytical purposes and is optimized for reading and aggregating large volumes of historical data Data warehouses support complex queries and reporting needs

Explain the ETL process
Answer ETL stands for Extract Transform Load It is a process used to move data from source systems to a data warehouse

Extract Data is extracted from various source systems

Transform The extracted data is transformed into a suitable format or structure for querying and analysis This may involve cleaning filtering and aggregating the data

Load The transformed data is loaded into the target data warehouse

What is the difference between supervised and unsupervised learning
Answer Supervised learning involves training a model on labelled data meaning the model learns from input output pairs to make predictions Examples include regression and classification tasks

Unsupervised learning on the other hand deals with unlabelled data and aims to find hidden patterns or intrinsic structures within the data such as clustering and association tasks

How would you handle missing data in a dataset
Answer Handling missing data can be done in several ways

Deletion Removing rows or columns with missing values if they are not crucial or if the proportion of missing data is small

Imputation Filling in missing values using various methods such as mean median mode or more sophisticated techniques like K Nearest Neighbours KNN imputation or regression imputation

Prediction Models Using machine learning models to predict and fill in missing values based on other available data

What is a JOIN in SQL Describe different types of JOINS
Answer A JOIN in SQL is used to combine rows from two or more tables based on a related column between them

Types of JOINS include

INNER JOIN Returns only the rows with matching values in both tables

LEFT JOIN LEFT OUTER JOIN Returns all rows from the left table and matched rows from the right table Unmatched rows from the left table will have NULLs for columns from the right table

RIGHT JOIN RIGHT OUTER JOIN Returns all rows from the right

table and matched rows from the left table Unmatched rows from the right table will have NULLs for columns from the left table FULL JOIN FULL OUTER JOIN Returns all rows when there is a match in either table Unmatched rows will have NULLs from the other table CROSS JOIN Returns the Cartesian product of the two tables meaning all possible combinations of rows
