### **Advancing neural network-based intelligent algorithms in robotics: challenges, solutions, and future perspectives**

Long Jin, Xin Ma, 2025-09-15 The integration of neural network based intelligent algorithms with robotics has revolutionized the field of robotics in recent years. Inspired by the human brain, neural networks have shown great potential in enabling robots to learn from data, make intelligent decisions, and perform complex tasks. These algorithms have been applied in various areas of robotics, including perception, control, planning, and learning. More precisely, convolutional neural networks (CNNs) have significantly improved robot vision capabilities, while recurrent neural networks (RNNs) have enhanced sequential data processing for tasks such as speech recognition and natural language understanding. Deep reinforcement learning algorithms have enabled robots to learn optimal control policies through interaction with their environment.

Additionally, recurrent neural networks have contributed to the stability, control performance improvement, and redundancy resolution of robots. The continuous advancements in neural network based algorithms in robotics hold great promise for the future of intelligent robotic systems.

*Reviews in cancer imaging and image-directed interventions* Omar Sultan Al-Kadi, Oliver Diaz, 2023-05-25 **Rapid and Nondestructive Detection Techniques for Agri-Product Quality** Te Ma, Xi Tian, Qiang Lyu, Lie Deng, 2024-08-13 Agri product such as grains fruits and vegetables play a very important role in people's daily life The agri product quality directly affects human life and health Agri product quality refers to the quality characteristics acceptable to consumers which mainly includes external factors such as size shape color defect and texture and internal factors such as physical properties chemical composition and tissue diseases Generally speaking variety climate soil cultivation techniques diseases and pests are all factors that affect the agri product quality Traditional methods for agri product quality evaluation are time consuming complex and expensive With the continuous development of modern science and technology rapid and nondestructive detection technologies are applied to evaluate the quality of agri product These technologies could obtain the optical acoustics and electrical properties of a specific substance and then reveal the appearance and internal quality of the agri product Furthermore the trend today is that consumers have become more exigent for information about the products they purchase which makes the nondestructive detection technology has more important application value in the field of agri product quality evaluation

**An Adaptive Region Growing based on Neutrosophic Set in Ultrasound Domain for Image Segmentation** XUE JIANG, YANHUI GUO, HAIBIN CHEN, YAQIN ZHANG, YAO LU, Breast tumor segmentation in ultrasound is important for breast ultrasound BUS quantitative analysis and clinical diagnosis Even this topic has been studied for a long time it is still a challenging task to segment tumor in BUS accurately arising from difficulties of speckle noise and tissue background inconsistency To overcome these difficulties we formulate breast tumor segmentation as a classification problem in the neutrosophic set NS domain which has been previously studied for removing speckle noise and enhancing contrast in BUS images The similarity set score and homogeneity value for each pixel have been calculated in the NS domain to characterize each pixel of BUS image Based on that the seed regions are selected by an adaptive Otsu based thresholding method and morphology operations then an adaptive region growing approach is developed for obtaining candidate tumor regions in NS domain

*Navigating the Depths. Effective Classification of Imbalanced Plankton Classes* Showkat Ahmad, 2024 A Convolutional Neural Network-based Approach to Personalized 3D Modeling of the Human Body and Its Classification Semanti Basu, 2020 In this thesis we introduce an integrated method to build personalized full body 3D models of people given frontal and profile silhouette images Several deep convolutional neural network CNN architectures have been designed and trained to accurately estimate the positions of a set of anthropometric set of ordered control points on the frontal and profile silhouette

images For the prediction of key points on the frontal silhouette image the output from four different convolutional neural networks have been fused together to generate the final coordinates A global CNN is first designed to predict those control points on all parts of the body This has been reinforced with local deep CNN architectures focused on the prediction of control points on localized areas of the body to improve on the accuracy of predictions Fusing the global and local predictions yielded an estimate of the coordinates of 56 control points on the frontal image and 26 control points on the side view image of a person The controlled points are then regularized to reside on the silhouette of the frontal and profile images using a combination of Canny edge detector and shortest distance mapping The set of regularized control points are then fed into a model based 3D reconstruction algorithm 1 to yield the corresponding high resolution 3D model of the person A database of 800 models from the Caesar dataset were studied of which 100 were used to train and the other 700 were used for testing and classification of 3D models Our method achieves an accuracy of 99.7 % in prediction of control points and 3D reconstruction using those points We also present a classification scheme to allocate a test surface to one of competing base surfaces The classification is based on computing the error between salient points with identical anthropometric meaning that reside on a nested set of boundaries in the frontal and profile projection image spaces The method can have a variety of applications ranging from medical imaging to 3D modeling for recognition virtual reality generation of video games 3D animation etc
