This work was done as an undergraduate student: if you really don't understand something in one of these proofs, it is very possible that it doesn't make sense because it's wrong. Any questions or corrections can be directed to jason.rosendale@gmail.com.

Exercise 1.1.1

(a) is not associative: $3 - (2 - 1) \neq (3 - 2) - 1$. (b),(c),and (d) can be shown to be associative by grinding out the algebra and showing that $a * (b * c) = (a * b) * c$. (e) is not associative, as can be shown by letting $a = b = c = 2$.

Exercise 1.1.2

(a) and (c) can be shown to not be commutative by letting $a = 1, b = 2$. (b),(c) and (d) can be shown to be commutative by grinding out the algebra.

Exercise 1.1.3

$$\begin{aligned}\overline{a+b+c} &= \overline{a+b+c} \\ &= \overline{a+b+c} \quad \text{def. of modular addition} \\ &= \overline{a+b+c} \quad \text{def. of modular addition}\end{aligned}$$

Exercise 1.1.4

$$\begin{aligned}\overline{ab \cdot c} &= \overline{ab \cdot c} \\ &= \overline{ab \cdot c} \quad \text{def. of modular multiplication} \\ &= \overline{ab \cdot c} \quad \text{def. of modular multiplication}\end{aligned}$$

Exercise 1.1.5

To be a group, each element a would need a multiplicative inverse b such that $ab = 1$; but \mathbb{Q} has no such inverse.

Exercise 1.1.6

(b) is not closed: $1/14 + 1/14 = 1/7$. (c) is not closed: $2/3 + 2/3 = 4/3$. (d) is not closed: $2 + (-3/2) = 1/2$. (f) is not closed: $1/2 + 1/3 = 5/6$. (a) and (e) are groups under addition.

Exercise 1.1.7

That $x * y$ is well-defined follows directly from the fact that $+$, \cdot , and the greatest integer function are well defined on \mathbb{R} . To prove that G is a group: G has an identity element ($0 \in G$ and $0 * x = x * 0 = x - [x] = 0$), each

How Many Zeroes? Pinaki Mondal, 2021-11-07 This graduate textbook presents an approach through toric geometry to the problem of estimating the isolated solutions counted with appropriate multiplicity of n polynomial equations in n variables over an algebraically closed field The text collects and synthesizes a number of works on Bernstein's theorem of counting solutions of generic systems ultimately presenting the theorem commentary and extensions in a comprehensive and coherent manner It begins with Bernstein's original theorem expressing solutions of generic systems in terms of the mixed volume of their Newton polytopes including complete proofs of its recent extension to affine space and some applications to open problems The text also applies the developed techniques to derive and generalize Kushnirenko's results on Milnor numbers of hypersurface singularities which has served as a precursor to the development of toric geometry Ultimately the book aims to present material in an elementary format developing all necessary algebraic

geometry to provide a truly accessible overview suitable to second year graduate students

Ideals, Varieties, and Algorithms David A. Cox, John Little, Donal O'Shea, 2025-08-23 This text covers topics in algebraic geometry and commutative algebra with careful attention to their practical and computational aspects The first four chapters form the core of the book A comprehensive chart in the Preface illustrates a variety of ways to proceed with the material once these chapters are covered In addition to the fundamentals of algebraic geometry the elimination theorem the extension theorem the closure theorem and the Nullstellensatz there are chapters on polynomial and rational functions between varieties robotics and geometric theorem proving invariant theory of finite groups projective algebraic geometry dimension theory and progress made over the last decades in computing Gröbner bases The fifth edition builds on the fourth edition in two main ways First a number of typographical errors found by readers and by the authors since 2018 have been corrected Second new material on toric varieties monomial curves and other topics of current interest in algebraic geometry has been added This enhances the opportunities for active learning through new examples new exercises and new projects in Appendix D all supplemented by additional references The book also includes updated computer algebra material in Appendix C The book may be used for a first or second course in undergraduate abstract algebra and with some augmentation perhaps for beginning graduate courses in algebraic geometry or computational commutative algebra Prerequisites for the reader include linear algebra and a proof oriented course It is assumed that the reader has access to a computer algebra system Appendix C describes features of Maple Mathematica and SageMath as well as other systems that are most relevant to the text Pseudocode is used in the text Appendix B carefully describes the pseudocode used From the reviews of previous editions The book gives an introduction to Buchberger's algorithm with applications to syzygies Hilbert polynomials primary decompositions There is an introduction to classical algebraic geometry with applications to the ideal membership problem solving polynomial equations and elimination theory The book is well written The reviewer is sure that it will be an excellent guide to introduce further undergraduates in the algorithmic aspect of commutative algebra and algebraic geometry Peter Schenzel *zbMATH* 2007 I consider the book to be wonderful The exposition is very clear there are many helpful pictures and there are a great many instructive exercises some quite challenging offers the heart and soul of modern commutative and algebraic geometry *The American Mathematical Monthly*
