

Theory and Practice of Artificial Intelligence

Abstract

If you don't understand artificial intelligence, ask yourself if I am right because others don't understand it either.

There is no generally applicable definition of artificial intelligence.

The field is so vast that its actors will always have to develop a more precise definition of their own objectives in their context.

Artificial intelligence is broadly defined as the simulation of human intelligence by machines programmed to learn, reason, and solve problems.

Therefore, AI encompasses several subfields, including machine learning (ML), deep learning (DL), robots, natural language processing (NLP), and computer vision, etc., each with distinct applications and limitations.

And yet, AI can be classified into two main categories:

i- Narrowly defined AI (concrete definition of AI)

Which is simply defined as an automated algorithm operating on the basis of statistical transition matrices, which allows it to increase the amount of existing information.

ii- General AI (broad definition of AI):

such as machine learning (ML), deep AI (DAI), image and voice recognition, etc.

AAAI proceedings describe innovative concepts techniques perspectives and observations that present promising research directions in artificial intelligence The focus of the AAAI 92 conference is on the re integration of AI as a diverse but coherent whole Accordingly the traditional list of community based content areas has been replaced by a more neutral set of taxonomies that span the field For example a paper proposing a new epistemology for representing the physical world based on an analysis of human brain structure would be described as representation physical world biological The papers collected here represent significant research contributions to such areas as the principles underlying cognition perception and action in man and machine the design application and evaluation of AI algorithms and systems and the analysis of domains in which AI systems perform
