You can use iteration to find approximations for  $f(x) = 0$ , to any desired degree of accuracy...

Show that the iteration formulae:

$$x_{n+1} = \sqrt{5x_n + 3} \quad x_{n+1} = \frac{x_n^2 - 3}{5}$$

Give different roots of the equation:

$$x^2 - 5x - 3 = 0$$

Use  $x_0 = 5$

$$x_{n+1} = \sqrt{5x_n + 3} \quad x_0 = 5$$

$$x_1 = \sqrt{5(5) + 3} \quad x_1 = 5.29\dots$$

$$x_2 = \sqrt{5(5.29\dots) + 3} \quad x_2 = 5.4274\dots$$

$$x_3 = \sqrt{5(\text{Ans}) + 3} \quad x_3 = 5.489\dots$$

$$x_4 = \sqrt{5(\text{Ans}) + 3} \quad x_4 = 5.51\dots$$

$x_4$  is usually enough unless specified!

**Numerical Methods** J. Douglas Faires, Richard L. Burden, 1998 This text emphasizes the intelligent application of approximation techniques to the type of problems that commonly occur in engineering and the physical sciences The authors provide a sophisticated introduction to various appropriate approximation techniques they show students why the methods work what type of errors to expect and when an application might lead to difficulties and they provide information about the availability of high quality software for numerical approximation routines The techniques covered in this text are essentially the same as those covered in the Sixth Edition of these authors top selling Numerical Analysis text but the emphasis is much different In Numerical Methods Second Edition full mathematical justifications are provided only if they are concise and add to the understanding of the methods The emphasis is placed on describing each technique from an implementation standpoint and on convincing the student that the method is reasonable both mathematically and computationally
