10 TYPES OF ARTIFICIAL NEURAL NETWORKS

1 Feedforward Neural Networks (FNNs)

The simplest type of ANN, where connections between the nodes do not form a cycle. This network moves information forward from input to output layers, possibly through multiple hidden layers.

3 Recurrent Neural Networks (RNNs)

Networks with loops allowing information to be stored within the network, which makes them ideal for sequential data such as time series, speech, text, and financial data.

5 Gated Recurrent Units (GRUs)

This network moves information forward from input to output layers, possibly through multiple hidden layers.

7 Generative Adversarial Networks (GANs)

Consist of two networks, a generator and a discriminator, that are trained simultaneously. GANs are used in unsupervised learning tasks like generating realistic images and videos.

9 Self-Organizing Maps (SOMs)

Unsupervised learning networks used for dimensionality reduction, mainly in feature detection and visualization of high-dimensional data.

8 Radial Basis Function (RBF) Networks

Utilize radial basis functions as activation functions. They are used in function approximation, time series prediction, and control systems.

10 Modular Neural Networks

Composed of a series of different networks working independently and contributing towards the output. Used in complex problems where the task can be divided into smaller tasks.

2 Convolutional Neural Networks (CNNs)

Designed for processing data that come in the form of multiple arrays, such as images. CNNs are widely used in image and video recognition, image classification and medical image analysis.

4 Long Short-Term Memory Networks (LSTMs)

A kind of RNN capable of learning long-term dependencies. Useful for tasks that require remembering information for long periods, such as in language modeling and translation.

6 Autoencoders

Used for unsupervised learning, particularly in dimensionality reduction and feature learning.

Rogers,Matthew Kabrisky,1991 **Artificial Neural Networks** V. Rao Vemuri,1992 **Recent Advances in Artificial Neural Networks** L. C. Jain,2018-05-04 Neural networks represent a new generation of information processing paradigms designed to mimic in a very limited sense the human brain They can learn recall and generalize from training data and with their potential applications limited only by the imaginations of scientists and engineers they are commanding tremendous popularity and research interest Over the last four decades researchers have reported a number of neural network paradigms however the newest of these have not appeared in book form until now Recent Advances in Artificial Neural Networks collects the latest neural network paradigms and reports on their promising new applications World renowned experts discuss the use of neural networks in pattern recognition color induction classification cluster detection and more Application engineers scientists and research students from all disciplines with an interest in considering neural networks for solving real world problems will find this collection useful **Deep Learning for NLP and Speech Recognition** Uday Kamath,John Liu,James Whitaker,2019-06-10 This textbook explains Deep Learning Architecture with applications to various NLP Tasks including Document Classification Machine Translation Language Modeling and Speech Recognition With the widespread adoption of deep learning natural language processing NLP and speech applications in many areas including Finance Healthcare and Government there is a growing need for one comprehensive resource that maps deep learning techniques to NLP and speech and provides insights into using the tools and libraries for real world

applications Deep Learning for NLP and Speech Recognition explains recent deep learning methods applicable to NLP and speech provides state of the art approaches and offers real world case studies with code to provide hands on experience Many books focus on deep learning theory or deep learning for NLP specific tasks while others are cookbooks for tools and libraries but the constant flux of new algorithms tools frameworks and libraries in a rapidly evolving landscape means that there are few available texts that offer the material in this book The book is organized into three parts aligning to different groups of readers and their expertise The three parts are Machine Learning NLP and Speech Introduction The first part has three chapters that introduce readers to the fields of NLP speech recognition deep learning and machine learning with basic theory and hands on case studies using Python based tools and libraries Deep Learning Basics The five chapters in the second part introduce deep learning and various topics that are crucial for speech and text processing including word embeddings convolutional neural networks recurrent neural networks and speech recognition basics Theory practical tips state of the art methods experimentations and analysis in using the methods discussed in theory on real world tasks Advanced Deep Learning Techniques for Text and Speech The third part has five chapters that discuss the latest and cutting edge research in the areas of deep learning that intersect with NLP and speech Topics including attention mechanisms memory augmented networks transfer learning multi task learning domain adaptation reinforcement learning and end to end deep learning for speech recognition are covered using case studies   Neural Network Fundamentals with Graphs, Algorithms, and Applications Nirmal K. Bose,Ping Liang,1996   An Introduction to Neural Networks James A. Anderson,1995 An Introduction to Neural Networks falls into a new ecological niche for texts Based on notes that have been class tested for more than a decade it is aimed at cognitive science and neuroscience students who need to understand brain function in terms of computational modeling and at engineers who want to go beyond formal algorithms to applications and computing strategies It is the only current text to approach networks from a broad neuroscience and cognitive science perspective with an emphasis on the biology and psychology behind the assumptions of the models as well as on what the models might be used for It describes the mathematical and computational tools needed and provides an account of the author s own ideas Students learn how to teach arithmetic to a neural network and get a short course on linear associative memory and adaptive maps They are introduced to the author s brain state in a box BSB model and are provided with some of the neurobiological background necessary for a firm grasp of the general subject The field now known as neural networks has split in recent years into two major groups mirrored in the texts that are currently available the engineers who are primarily interested in practical applications of the new adaptive parallel computing technology and the cognitive scientists and neuroscientists who are interested in scientific applications As the gap between these two groups widens Anderson notes that the academics have tended to drift off into irrelevant often excessively abstract research while the engineers have lost contact with the source of ideas in the field Neuroscience he points out provides a rich and valuable source of ideas about
