Exploring Human Genetics

Genetics is the study of how traits are passed from parents to offspring. In this lab, you will explore the inheritance of a trait in humans and perform a chi-square analysis to determine if the observed results fit the expected Mendelian ratios.

Procedure:

1. Identify a trait that is controlled by a single gene with two alleles (e.g., earlobe attachment).
2. Determine the genotypes of the parents based on their phenotypes.
3. Perform a Punnett square to predict the possible genotypes and phenotypes of the offspring.
4. Collect data from a large number of offspring.
5. Perform a chi-square analysis to compare the observed results to the expected results.

Chi-Square Analysis:

Calculate the chi-square value using the formula: $\chi^2 = \sum \frac{(O - E)^2}{E}$

Compare the calculated chi-square value to the critical value from the chi-square distribution table for the appropriate degrees of freedom and significance level.

Conclusion:

Based on the chi-square analysis, the observed results are consistent with the expected Mendelian ratios, supporting the hypothesis that the trait is controlled by a single gene with two alleles.
