Derive an expression for Poiseuille's formula for liquid flowing through a capillary tube.

Ans → Consider a horizontal capillary tube of length  $L$  and radius  $a$  through which a liquid flows.  $\eta$  is the coefficient of viscosity of the liquid.  $P$  is the pressure difference b/w the ends of the tube.

The velocity of the liquid is maximum along the axis and is zero at the walls.  $(dv/dr)$  is the velocity gradient.

Consider a cylindrical shell of the liquid of inner radius  $r$  and outer radius  $r+dr$ .

The surface area of the shell =  $A = 2\pi r L$

The backward dragging viscous force acting on this layer is

$$F_1 = -\eta A \frac{dv}{dr} = -\eta 2\pi r L \frac{dv}{dr}$$

The driving force on the liquid shell accelerating it forward is  $F_2 = P \times \pi r^2$

$\therefore \pi r^2 \rightarrow$  Area of cross section of the inner cylinder.

When the motion is steady,

backward dragging force ( $F_1$ ) = Driving force ( $F_2$ )

$$-2\eta\pi r L \frac{dv}{dr} = P\pi r^2$$

$$dv = -\frac{P}{2\eta L} r dr$$

Integrating,  $v = -\frac{P}{2\eta L} \frac{r^2}{2} + C$

when  $r = a, v = 0$

$$0 = -\frac{P}{2\eta L} \frac{a^2}{2} + C$$

$$\text{or } C = \frac{Pa^2}{4\eta L}$$

$$v = \frac{P}{4\eta L} (a^2 - r^2)$$

**Fluid Mechanics for Civil Engineers** Bruce Hunt, 2020-09-12 Fluid Mechanics for Civil Engineers Department of Civil Engineering by Bruce Hunt New Zealand Fluid mechanics is a traditional cornerstone in the education of civil engineers As numerous books on this subject suggest it is possible to introduce fluid mechanics to students in many ways This text is an outgrowth of lectures I have given to civil engineering students at the University of Canterbury during the past 24 years It contains a blend of what most teachers would call basic fluid mechanics and applied hydraulics Chapter 1 contains an introduction to fluid and flow properties together with a review of vector calculus in preparation for chapter 2 which contains a derivation of the governing equations of fluid motion Chapter 3 covers the usual topics in fluid statics pressure distributions forces on plane and curved surfaces stability of floating bodies and rigid body acceleration of fluids Chapter 4 introduces the use of control volume equations for one dimensional flow calculations Chapter 5 gives an overview for the problem of solving partial differential equations for velocity and pressure distributions throughout a moving fluid and chapters 6 9 fill in the details of carrying out these calculations for irrotational flows laminar and turbulent flows boundary layer flows secondary flows and flows requiring the calculation of lift and drag forces Chapter 10 which introduces dimensional analysis and model similitude requires a solid grasp of chapters 1 9 if students are to understand and use effectively this very important tool for experimental work Chapters 11 14 cover some traditionally important application areas in hydraulic engineering Chapter 11 covers steady pipe flow chapter 12 covers steady open channel flow chapter 13 introduces the method of characteristics for solving water hammer problems in unsteady pipe flow and chapter 14 builds upon material in chapter 13 by using characteristics to attack the more difficult problem of unsteady flow in open channels Throughout I have tried to use mathematics experimental evidence and worked examples to describe and explain the elements of fluid motion in some of the many different contexts encountered by civil engineers The study of fluid mechanics requires a subtle blend of mathematics and physics that many students find difficult to master Classes at Canterbury tend to be large and sometimes have as many as a hundred or more students Mathematical skills among these students vary greatly from the

very able to mediocre to less than competent As any teacher knows this mixture of student backgrounds and skills presents a formidable challenge if students with both stronger and weaker backgrounds are all to obtain something of value from a course My admittedly less than perfect approach to this dilemma has been to emphasize both physics and problem solving techniques For this reason mathematical development of the governing equations which is started in Chapter 1 and completed in Chapter 2 is covered at the beginning of our first course without requiring the deeper understanding that would be expected of more advanced students A companion volume containing a set of carefully chosen homework problems together with corresponding solutions is an important part of courses taught from this text Most students can learn problem solving skills only by solving problems themselves and I have a strongly held belief that this practice is greatly helped when students have access to problem solutions for checking their work and for obtaining help at difficult points in the solution process A series of laboratory experiments is also helpful However courses at Canterbury do not have time to include a large amount of experimental work For this reason I usually supplement material in this text with several of Hunter Rouse's beautifully made fluid mechanics films
