Abstract:

Expansive soils exhibit volume instability, cyclic swell-shrink behavior and low strength. These soils are improved by various stabilization methods. Stabilization of such soils includes both physical stabilization and chemical stabilization. Attempts have been made by many researchers in trying to proffer solutions to this defect by experimenting in innovative ways with different materials that could possibly improve the soil engineering properties and reduce environmental hazards. A more effective and efficient use of natural resources make it suitable for construction and as well be very cost effective. Currently there are large volumes of materials considered as wastes or by-products produced by industrial activities. Wastes from different industries have been used for this purpose. This paper highlights the results of works done by different researchers on stabilization of expansive soil using stone waste materials as soils stabilizers and for decreasing the environmental hazards. The results of laboratory tests such as unconfined compression strength test (UCS), California bearing ratio (CBR), free swell index, liquid limit, plastic limit, compaction, etc. were presented and discussed in this paper.

Keywords: Expansive soils, stabilization, stone waste, environmental hazards.

Expansive Soils:

Expansive soil problems can occur in both arid and semi-arid soils and humid environments. The engineering properties and behavior of these problematic soils change drastically, they would get increased in volume and hence they would swell. On the other hand, the shrinkage happens when the soil gets dry [1-3]. The excessive movements resulted from these problematic soils can lead to both damage and negative impact on roads, buildings, pipelines, and other structural members which is even more than twice the damage resulted from hurricanes floods, earthquakes, and tornadoes. Understanding the behavior and characteristics of these types of soils can help scientists to control the imposed damages to the structures, [4]. Expansive soil problems usually happen because of the changes in the water content in the upper few meters, with deep seated heave being rare. The climate and environmental parameters considerably affect the water content in these upper layers. The water content is generally termed the zone of seasonal fluctuations or active zone [1]. Expansive soil is a highly plastic soil that normally contains montmorillonite and other active clay minerals. Some clay minerals such as, montmorillonite have the greatest volume change in comparison to all the

Stabilization of Expansive Soils by Using Aggregate Waste, Rock Powder and Lime ,2004 Expansive soils are a worldwide problem that poses several challenges for civil engineers Such soils swell when given an access to water and shrink when they dry out The most common and economical method for stabilizing these soils is using admixtures that prevent volume changes In this study the effect of using rock powder and aggregate waste with lime in reducing the swelling potential is examined The expansive soil used in this study is prepared in the laboratory by mixing kaolinite and bentonite Lime was added to the soil at 0 to 9 percent by weight Aggregate waste and rock powder were added to the soil at 0 to 25 percent by weight Grain size distribution Atterberg limits and swell percent and rate of swell of the mixtures were determined Specimens were cured for 7 and 28 days This method of treatment caused a reduction in the swelling potential and the reduction was increased with increasing percent stabilizers Chemical Abstracts ,2002

New Ways of Dealing With Soil in Constructions? Soil Stabilization Using Brick, Dust and Cement Nimur Rahaman Durjoy, 2020-09-10 Bachelor Thesis from the year 2019 in the subject Engineering Geotechnology grade A language English abstract The nature of soil is an ambiguous property unlike it is treated to know the basic engineering parameters Usually soil and soft soils cause difficulties in construction site when having low strength and low stiffness To enhance the engineering property soil needs to be stabilized This study is an experimental base research where brick dust and cement are used to stabilize the soil to explore the more uses of raw materials like this as well as to improve the quality of soft soil at the proposed site of Manikdi Dhaka The soil is classified as a clayey soil and determined the plastic limit liquid limit specific gravity grain size Secondly to compare the strength and characteristics of existing soil before and after treating with the combination of brick dust and cement We used two different mixed ratio and natural soil to conduct this experiment From unconfined compression strength test of natural soil soil with mix ratio Cement Brick Dust Soil 1 1 5 7

and soil with mixed ratio Cement Brick Dust Soil 1 2 7 were 483 7 kPa 737 2 kPa and 967 8 kPa consequently So we found that the stress is increasing with increasing amount of cement and brick dust From The grain size analysis the Cu value of natural soil soil with mix ratio Cement Brick Dust Soil 1 1 5 7 and soil with mixed ratio Cement Brick Dust Soil 1 2 7 were 4 3 5 06 and 3 25 consequently Also we found that the Cc value of natural soil soil with mix ratio Cement Brick Dust Soil 1 1 5 7 and soil with mixed ratio Cement Brick Dust Soil 1 2 7 were 0 84 0 879 and 0 83 consequently So for this three cases the soil sample was poorly graded From the Atterberg limit test the liquid limit for natural soil soil with mix ratio Cement Brick Dust Soil 1 1 5 7 and soil with mixed ratio Cement Brick Dust Soil 1 2 7 were 36 07% 34 63% and 33 17% consequently the plastic limit were 24 81% 22 09% and 21 08% consequently So we can say that the liquid limit and plastic limit is decreasing with increasing amount of cement and brick dust

A Comparative Evaluation of Various Additives Used in the Stabilization of Expansive Soils AA. Al-Rawas,R. Taha,JD. Nelson,H. Al-Siyabi,2002 This paper investigates the effectiveness of using cement by pass dust copper slag granulated blast furnace slag and slag cement in reducing the swelling potential and plasticity of expansive soils The soil used in this study was brought from Al Khod a town located in Northern Oman where structural damage was observed The first stage of the experimental program dealt with the determination of the chemical mineralogical and geotechnical characteristics of the untreated soil The soil was then mixed with the stabilizers at 3 6 and 9% of the dry weight of the soil The treated samples were subjected to liquid limit plastic limit swell percent and swell pressure tests Furthermore the cation exchange capacity exchangeable cations Na Ca Mg and K and pH of the treated samples were also measured The study showed that copper slag caused a significant increase in the swelling potential of the treated samples Other stabilizers reduced the swelling potential and plasticity at varying degrees The study further indicated that cation exchange capacity and the amount of sodium and calcium cations are good indicators of the effectiveness of chemical stabilizers used in soil stabilization

STABILIZATION OF EXPANSIVE SOILS BY ÇAYIRHAN FLY ASH AND DESULPHOGYPSUM. ,2001

Expansive soils are one of the most serious problems which the foundation engineer faces Several attempts are being made to control the swell shrink behavior of these soils One of the most effective and economical methods is to use chemical additives Fly ash and desulphogypsum both of which are by products of coal burning thermal power plants are accumulating in large quantities all over the world and pose serious environmental problems In this study the expansive soil was stabilized using the fly ash and desulphogypsum obtained from ay rhan Thermal Power Plant Fly ash and desulphogypsum were added to the expansive soil from 0 to 30 percent Lime was used to see how efficient fly ash and desulphogypsum on expansive soil stabilization were and was added to the expansive soil from 0 to 8 percent The properties obtained were chemical composition grain size distribution consistency limits swelling percentage and rate of swell Fly ash desulphogypsum and lime added samples were cured for 7 days and 28 days after which they were subjected to free swell tests Swelling percentage decreased and rate of swell increased with increasing stabilizer percentage Curing resulted in further reduction in swelling percentage and further increase in rate of swell 25 percent and 30 percent fly ash and desulphogypsum additions reduced the swelling percentage to levels comparable to lime stabilization
