**The Institutional Topology of International Regime Complexes** Benjamin Daßler, 2023-09-12 The implicit topology of international institutional complexes varies greatly across policy areas In some areas the lion s share of everyday policy cooperation is shaped by a single institution with alternative and more regional institutions operating in its shadow In other policy fields institutional structures appear to be different seeing a range of non hierarchical decentralized alternative institutions The Institutional Topology of International Regime Complexes Mapping Inter Institutional Structures in Global Governance provides a systematic conceptualization and explanation of the evolution of these varying institutional topologies underlying regime complexes across five issue areas of Global Governance Intellectual Property Protection Tax Avoidance Financial Stability Development Aid and Energy Governance By providing an empirically grounded network based conceptualization and mapping of institutional topologies as well as a theoretical explanation for their variation across policy space and time the book offers a comprehensive analysis of both the empirical manifestation of inter institutional structures across various policy fields of Global Governance and the issue specific factors that shape the varying institutional trajectories spurring decentralization Da ler combines quantitative network analyses with qualitative case studies to trace institutional decentralization processes across five highly relevant issue areas of Global Governance This volume shows how the nature of issue specific cooperation problems translates into disparate structures among multilateral institutions occupying the same regime complex In light of growing concerns about the future trajectories of Global Governance in times of heightened geopolitical tensions Da ler offers a fresh perspective to comparatively capture the profoundly varying institutional landscapes across different issue areas and their associated challenges and benefits of multilateral cooperation

Transformations in Governance is a major academic book series from Oxford University Press. It is designed to accommodate the impressive growth of research in comparative politics, international relations, public policy, federalism, and environmental and urban studies concerned with the dispersion of authority from central states to supranational institutions, subnational governments, and public-private networks. It brings together work that advances our understanding of the organization, causes, and consequences of multilevel and complex governance. The series is selective, containing annually a small number of books of exceptionally high quality by leading and emerging scholars. The series is edited by Liesbet Hooghe and Gary Marks of the University of North Carolina, Chapel Hill, and Walter Mattli of the University of Oxford.

*FOSSIL FUELS AND THE ENVIRONMENT*

Adeniyi A. Afonja, Climate change is a major global issue today and one of the most controversial. The debate is full of well-mixed ideals, myths, and realities. The pro-climate change world has an aggressive global campaign machinery against fossil energy use, which is believed to be the cause of global warming and climate change. The sceptics are just as strong; either they do not believe that the climate is changing or they think human activities have nothing to do with it. Infusion of politics, inspired by intra-country exigencies, has further complicated the issues, and it has become difficult to distinguish between realities, facts, and fiction. Ideals and myths are strong weapons for sensitizing and motivating global mitigation action on climate change, but it is also useful to know what is real or possible. Facing realities would help to focus on feasible, sustainable adaptation and mitigation actions that could help the world optimize energy use and deal with the consequences of climate change.

Global warming is one of the major indicators of climate change, and extensive climate database shows that the average global temperature has been rising steadily from pre-industrial 14°C, and although there are many natural phenomena that can cause the Earth to heat up or cool, strong scientific evidence indicates that between 0.8°C and 1.2°C of the rise has been caused by human activities which release heat-trapping greenhouse gases (GHGs) into the atmosphere, mostly in the last seven decades or so. This apparently small temperature rise can have very big impact on the global climate, largely because the oceans, which occupy around three quarters of the Earth's surface area, absorb over 90% of the anthropogenic heat and much of the carbon dioxide. An increase in the average global temperature by even less than 1°C can have a profound influence on weather and climate in many ways, in particular wind dynamics and the intensity, frequency, and geographical spread of extreme weather, draught, and desertification. Also, about 7 million deaths annually are associated with environmental pollution. Although there are many natural phenomena that can cause global warming and climate change, ample scientific evidence shows that human activities, particularly in the last seven decades or so, have exacerbated the negative impacts on weather, climate, human health, and the survival of the ecosystem, with potentially devastating consequences which may resonate for centuries, even millennia.

Fossil fuels have powered the global economy for centuries, but also account for by far the largest share of anthropogenic emissions that have been causing profound environmental issues. Considering the pivotal role of fossil fuels in industry, transportation, and building sectors of the global economy, the

vital role fossil energy production and trading in country economies security and human development across all regions of the world and the currently slow rate of decarbonizing energy the dominance will likely persist for decades This book discusses in depth the global energy resources production and use by the different sectors of the economy and associated environmental issues The extensive recent publications on energy use and the environment are reviewed in depth alternative pathways to a lower carbon energy global economy are discussed and strategies for adaptation and mitigation that could place the world on the pathway towards a sustainable environment are presented
