GIS Basics Stephen Wise, 2018-10-08. Geographical Information Systems (GIS) are computer systems for storing, displaying, and analyzing spatial data. The past twenty years have seen a rapid growth in their use in government, commerce, and academia, and they can be used for managing a network of utilities, from handling census data through to planning the location of a new supermarket. But how do they work? Stephen Wise has been a regular contributor to GeoEurope, and his Back to Basics articles have provided a clear and simple introduction to the inner workings of GIS for a non-specialist audience. He now presents the original articles with new material and provides a new coverage of both major types of GIS: vector and raster systems. Undergraduates and professionals who wish to improve their knowledge of GIS should get a better understanding of how GIS operate in the way that they do, such as how spatial data is stored on a computer, how the different methods affect the capabilities of the GIS, how basic operations are performed, and how the choice of algorithm affects the speed of the system.

The Correctness-by-Construction Approach to Programming Derrick G. Kourie, Bruce W. Watson, 2012-04-12. The focus of this book is on bridging the gap between two extreme methods for developing software. On the one hand, there are texts and approaches that are so formal that they scare off all but the most dedicated theoretical computer scientists. On the other, there are some who believe that any measure of formality is a waste of time, resulting in software that is developed by following gut feelings and intuitions. Kourie and Watson advocate an approach known as correctness by construction, a technique to derive algorithms that relies on formal theory but that requires such theory to be deployed in a very systematic and pragmatic way. First, they provide the key theoretical background, like first-order predicate logic or refinement laws, that is needed to understand and apply the method. They then detail a series of graded examples, ranging from binary search to lattice cover, graph construction, and finite automata minimization, in order to show how it can be applied to increasingly complex algorithmic problems. The principal purpose of this book is to change the way software developers approach their task at programming, in the small level, with a view to improving code quality. Thus, it coheres with both the IEEE's Guide to the Software Engineering Body of Knowledge (SWEBOK) recommendations, which identifies themes covered in this book as part of the software engineer's arsenal of tools and methods, and with the goals of the Software Engineering Method and Theory (SEMAT) initiative, which aims to refound software engineering based on a solid theory.

BIM and 3D GIS Integration for Digital Twins Mohsen Kalantari, Christian Clemen, Mojgan Jadidi, 2024-12-09. Building information modelling (BIM) uses a combination of technologies and resources to capture, manage, analyse, and display a digital representation of the physical and functional characteristics of a facility. A Geographic Information System (GIS) offers tools for visualising and analysing built and natural environments and

their impacts on infrastructure systems such as land use transportation etc This book offers a framework for how the geospatial and surveying industry can create and integrate BIM with GIS Through practical implementation methods readers will learn to merge GIS data with design and BIM data to enable digital twins This book presents the following features Integrates BIM and GIS from a geospatial and surveying point of view for the first time Addresses the creation of BIM from existing constructed buildings instead of typical pre construction scenarios Explains how to deliver BIM suitable surveys to surveyors and geospatial practitioners Provides surveying and geospatial industry expertise in the collecting locating managing and communicating of BIM Introduces new knowledge on the validation and integration of BIM and GIS within the spatial industry This is an excellent book for professionals working with 3D data for built environment digital twins such as city planners land surveyors and geospatial practitioners It is also an insightful resource for those working and studying in the fields of GIS surveying and geospatial engineering providing the most current tools and resources for dealing with BIM

3-D Image Processing Algorithms N. Nikolaidis, Ioannis Pitas, 2000-11-06 Thorough up to date comprehensive coverage of 3 D image processing This authoritative guide presents and explains numerous 3 D image processing analysis and visualization techniques including volume filtering interpolation 3 D discrete Fourier transform evaluation of topological and geometrical features region segmentation and edge detection skeletonization and registration and visualization Necessary theoretical background is provided for each topic along with a number of algorithms selected on the basis of their acceptance by the scientific community The presentation of each technique includes a commented implementation either in C code or in C like pseudocode Though presented in an almost ready to run form the C code is simplified to expose the structure of the processing algorithms rather than their programming details This combination of theoretical treatment and C code implementation allows readers to gain a thorough insight into these techniques Important features of 3 D Image Processing Algorithms include A demo version of EIKONA 3D image processing software Lab exercises based on EIKONA 3D Accompanying transparencies summarizing the most important topics The material can be downloaded from an ftp site Based on the authors long experience in research and teaching of 2 D 3 D image processing 3 D Image Processing Algorithms is an indispensable resource for electrical computer and biomedical engineers as well as computer graphics professionals and programmers **Conference Companion on Human Factors in Computing Systems** Catherine Plaisant, 1994
