Transport in Plants II U. Lüttge, M.G. Pitman,1976-05-01 In the first part Part A of this volume on transport there was an emphasis on the processes occurring at the membranes bounding the cells It

was convenient to distinguish active and passive processes of transport across the membranes and to recognize that certain transport processes may be regulated by internal factors in the cells such as cytoplasmic pH concentrations of ions of malate or of sugar in the vacuoles or the hydrostatic pressure Cells in tissues and organs show the same kinds of properties as individual cells but in addition there can be cell to cell transport related to the organization of the tissue Firstly cells within a tissue are separated from the external solutions by a diffusion path comprising parts of the cell walls and intercellular spaces more generally this extra cytoplasmic part of the tissue has been called the apoplasm A similar term is free space Secondly the anatomy of cells in tissues seems to allow some facilitated local transport between cells in a symplasm Entry into the symplast and subsequent transport in a symplasmic continuum seems to be privileged in that ions may not have to mix with the bulk of the cytoplasm and can pass from cell to cell in particular cytoplasmic structures plasmodesmata In Chara plants this kind of transport is found operating across the multi cellular nodes as the main means of transport between the long internodal cells
