Spin Hall Effect And Spin Orbit Torques:

Current-driven Spin-orbit Torques in Ferromagnetic Heterostructures Jun Wu, 2017 The spin Hall effect SHE is the generation of spin separation by a charge current in a heavy metal HM with strong spin orbit interaction The generated pure spin current orthogonal to the charge current can exert a torque on the magnetization of an adjacent ferromagnetic layer FM in FM HM bilayer Due to the inversion symmetry breaking in such FM HM bilayer there exists a Rashba effect at the interface that can cause spin accumulation at the interface The accumulated spin can also exert a torque on the magnetization of the ferromagnetic layer The torque arising from the current driven SHE or Rashba effect is referred to as spin orbit torque SOT There are two types of SOT field like FL and damping like DL SOT both can cause FM layer magnetization reorientation or switching SOT has attracted intensive interest recently due to its potential application in low energy memory and logic devices DL SOT has been observed and widely investigated by researchers However FL SOT was rarely observed and neglected in most cases since it only can be measured in very thin FM layer because of the short spin dephasing length usually on the order of several atomic layers In this work we first demonstrate the existence and observation of the effective field of FL SOT in a CoFeB Ta bilayer by the spin transfer torque ferromagnetic resonance method Then we quantitatively determine the FL SOT in NiFe Pt system using the second order planar Hall effect PHE It is found that FL SOT persists even with an insertion of Cu spacer layer between NiFe and Pt which indicates that the SHE is the dominant mechanism for SOT In order to investigate the interfacial and bulk effects of SOT in FM HM bilayer both the DL and FL SOTs are measured in the CoFeB Pt system by the polar magneto optical Kerr effect MOKE and second order PHE respectively We found that the SHE is also the dominant mechanism in CoFeB Pt system However there is also a distinct interfacial contribution which is attributed to the Rashba effect There are two mechanisms contributing to the SHE intrinsic and extrinsic effect We show that the SHE in Au Cu alloy can be enhanced by the extrinsic scattering compared to pure Au or Cu It is also found that the DL SOT and FL SOT depend on temperature very differently in NiFe AuCu system A nearly linear dependence between the spin Hall angle and longitudinal resistivity suggests that skew scattering one of the extrinsic effect for SHE may be the dominant mechanism in Au Cu alloy

Spin-Orbit Torques in Topological Insulators Qiming Shao, 2015 Spin torque can toggle magnetization state of nanomagnets in magnetic tunnel junctions In heavy metals giant Spin Hall Effect gives rise to a large spin orbit torque SOT enabling magnetization switching of adjacent ferromagnets Spin torque ratio is the key parameter in determining energy efficiency Recently a giant SOT was demonstrated in topological insulators TIs which are a class of materials owing insulating bulk and metallic surface states Although several theoretical studies show that spin momentum locking of surface states generates this giant SOT experimental clarification is still lacking In this thesis we use the second harmonic anomalous Hall resistance to access the current induced spin orbit fields and thus SOTs Heavy metal ferromagnet heterostructure Ta CoFeB MgO is used to verify the validation of this method Then we quantitatively estimate the SOT in different TI chromium doped TI heterostructures with different magnetic dopant positions which shows the evidence of surface states originated SOTs At last we show that the magnitude of SOTs can be controlled by the gate voltage due to its semiconducting nature All these studies may contribute to the future low power spintronics

Journal of the Physical Society of Japan, 2018 **Anomalous Hall Effect and Spin-orbit Torques in Noncollinear Antiferromagnetic Mn₃Ni_{0.35}Cu_{0.65}N Thin Films** Adithya Rajan, 2025 The continued scaling of conventional charge based electronics faces significant challenges creating an urgent need for alternative paradigms capable of delivering lowpower high speed and scalable computing technologies Spintronics by exploiting the spin and orbital degrees of freedom of electrons has emerged as a promising pathway particularly through the development of spin orbit torque SOT based

memory devices In this context noncollinear antiferromagnets NCAFM offer a unique materials platform combining vanishing net magnetization with exotic spin textures that can give rise to robust electronic transport phenomena such as the anomalous Hall effect AHE and unconventional spin orbit torques This thesis investigates the anomalous Hall effect and spin orbit torques in the cubic antiperovskite $\text{Mn}_3\text{Ni}_0.35\text{Cu}_0.65\text{N}$ Mn_3NiCuN A detailed experimental framework was established to disentangle higher order contributions to the AHE by performing angular dependent Hall measurements under both in plane and out of plane magnetic field geometries A nontrivial in plane AHE was observed confirming the presence of higher order multipolar contributions specifically an octupolar moment rather than conventional dipolar magnetization The angular dependence of the AHE exhibited a 120 symmetry consistent with the symmetry of the octupolar spin texture and was further supported by phenomenological modeling that incorporated scalar spin chirality SSC contributions to the transport signal In parallel spin orbit torques were investigated via second harmonic Hall measurements and spin torque ferromagnetic resonance ST FMR A significant enhancement of the damping like torque was observed near the N_{el} temperature This enhancement could be attributed to two alternative mechanisms i increased spin and orbital current generation from critical fluctuations of the noncollinear antiferromagnetic order and ii spin currents arising from fluctuation induced scalar spin chirality Notably this work presents the first experimental indication of orbital Hall effect contributions in a NCAFM offering a new perspective on angular momentum generation in complex magnetic systems The findings of this thesis provide direct insight into the role of higher order magnetic multipoles critical spin fluctuations and orbital transport in NCAFM Beyond advancing fundamental understanding these results highlight the potential of NCAFM for developing energy efficient field free spintronic devices marking a significant step toward exploiting complex magnetic textures for future information technologies

Nanowire Spin Torque Oscillator Driven by Spin Orbit Torques Andrew Smith, 2016

The field of spintronics deals with the use of the spin degree of freedom of the electron and the spin current that arises from it There are many static and dynamic applications for spin current whether it is supplied by spin polarized electric current from a magnetic layer or from spin orbit torques This dissertation will focus on the later cases where the spin Hall effect present in platinum supplies a spin torque on an adjacent permalloy layer creating a spin torque oscillator STO Previous studies have demonstrated the existence of STOs in the 0 dimensional case and its absence in the 2D case therefore the 1D case a ferromagnetic nanowire is tackled here This will cover the first instance of a micrometer scale STO and will show the excited modes are the edge and bulk spin wave eigenmodes of the nanowire

Spintronics Tomasz Blachowicz, Andrea Ehrmann, 2019 Starting from quantum mechanical and condensed matter foundations this book introduces into the necessary theory behind spin electronics Spintronics Equations of spin diffusion evolution and tunnelling are provided before an overview is given of simulation of spin transport at the atomic scale Furthermore applications are discussed with a focus on elementary spintronic devices such as spin valves memory cells and hard disk heads

Spin Current Sadamichi

Maekawa, Sergio O. Valenzuela, Eiji Saitoh, 2012-07-26 In a new branch of physics and technology called spin electronics or spintronics the flow of electrical charge usual current as well as the flow of electron spin the so called spin current are manipulated and controlled together This book is intended to provide an introduction and guide to the new physics and application of spin current Crystallographic Dependence of Spin Orbit Torques in Epitaxial Thin Films Bharat Grover, 2024* Spintronics is an emerging field in nanoelectronics utilizing the spin of electrons for data storage and manipulation In this thesis the characterization of spin orbit torques SOTs generated by spin currents from the spin Hall effect SHE in heavy metals is presented with a focus on Pt and the non collinear antiferromagnet Mn₃Pt In Pt three crystallographic orientations 111 110 and 001 were studied using optically detected ferromagnetic resonance OFMR and spin torque ferromagnetic resonance ST FMR with comparisons made to DC bias technique In Mn₃Pt the role of exchange bias was examined along 111 and 001 by inserting Cu between Mn₃Pt and Permalloy Py Damping like and field like torques were observed due to different spin polarization in Mn₃Pt Finally field dependent switching of ferromagnets with perpendicular anisotropy through Mn₃Pt SOT was demonstrated Handbook of Magnetism and Advanced Magnetic Materials: Spintronics and magnetoelectronics Helmut Kronmüller, Stuart S. P. Parkin, 2007 **Interplay of Rashba Effect and Spin Hall Effect in Perpendicular Pt/Co/MgO Magnetic Multilayers** *Project Supported by the National Basic Research Program of China (Grant No. 2015CB921401), the National Natural Science Foundation of China (Grant Nos. 51331002, 51371027, 51431009, 51471183, and 11274371), the National Instrumentation Program of China (Grant No. 2012YQ120048), and the Instrument Development Program of Chinese Academy of Sciences (Grant No. YZ201345). ,2016 Abstract The interplay of the Rashba effect and the spin Hall effect originating from current induced spin orbit coupling was investigated in the as deposited and annealed Pt Co MgO stacks with perpendicular magnetic anisotropy The above two effects were analyzed based on Hall measurements under external magnetic fields longitudinal and vertical to dc current respectively The coercive field as a function of dc current in vertical mode with only the Rashba effect involved decreases due to thermal annealing Meanwhile spin orbit torques calculated from Hall resistance with only the spin Hall effect involved in the longitudinal mode decrease in the annealed sample The experimental results prove that the bottom Pt Co interface rather than the Co MgO top one plays a more critical role in both Rashba effect and spin Hall effect

Spin-orbit Torque Measurements in Heavy Metal/ferromagnet Heterostructures Using the Magneto-optic Kerr Effect Halise Celik, 2018 Spin orbit coupling in heavy metal ferromagnet HM FM bilayer heterostructures has attracted considerable attention because it provides an efficient way to manipulate the magnetization with strong current driven spin orbit torques SOTs which may lead to new technologies for nonvolatile magnetic memory and logic devices An electric current flowing through a heavy metal generates a field like spin orbit torque FT and a damping like spin orbit torque DT on the magnetization of a neighboring ferromagnet Two mechanisms have been proposed to explain the generation of SOTs the

Rashba Edelstein effect due to interfacial spin orbit coupling and the spin Hall effect in the bulk of materials with strong spin orbit coupling SOC Much effort has been dedicated to identifying the dominant mechanism of the SOTs however the underlying mechanism for the SOC driven phenomena remained unsettled In this thesis we develop a sensitive SOT magnetometer based on the magneto optic Kerr effect MOKE that measures the SOTs for HM FM bilayers over a wide thickness range We observe that the DT inversely scales with the ferromagnet thickness and the FT has a threshold effect that appears only when the ferromagnetic layer is thinner than 1 nm Through a thickness dependence study with an additional copper insertion layer at the interface we conclude that both SHE and Rashba effect exist in HM FM heterostructures The relative strengths of their contributions depend on the material system We have also demonstrated that MOKE with normal incidence light can be used to obtain the DT and FT in HM FM bilayers by analyzing the polar Kerr effect as well as the quadratic Kerr effect The two effects can be distinguished by properly selecting the polarization of the incident light We study a series of Pt Py bilayers to verify the accuracy of this method The angular dependence of SOTs in Ta 2 nm CoFeB 1 nm MgO 3 nm trilayers with perpendicular magnetization is quantified based on polar MOKE with field calibration A strong angular dependence is observed that is different from the previous experimental observations Based on this strong angle dependence we conclude there is a strong Rashba effect in this system Simultaneous detection of current driven DT and FT in HM FM bilayers by measuring all three magnetization components and using a vector resolved MOKE technique based on quadrant detection has also been accomplished The technique can be easily extended to measure SOTs in systems with perpendicular magnetization as well as in systems with arbitrary magnetization direction

Relativistic Electronic Transport Theory Stephan Lowitzer, 2010 Spintronics is an emerging technology that exploits the intrinsic spin of the electron and its associated magnetic moment in addition to its fundamental electronic charge The central issue of this multidisciplinary field is the manipulation of the spin degree of freedom in solid state systems Discoveries in recent years have inspired a new route in spintronic research which needs no ferromagnetic components The research field spintronic without magnetism is based on the possibility to manipulate electric currents via spin orbit coupling only The spin Hall effect SHE is one of the most promising effects for the generation of spin polarized currents which is even present in non magnetic materials The SHE appears when an electric current flows through a medium with spin orbit coupling present leading to a spin current perpendicular to the charge current In this work the SHE as well as the anomalous Hall effect AHE are investigated on a first principles level using the spin polarized fully relativistic Korringa Kohn Rostoker Green's function method SPR KKR GF in conjunction with the linear response Kubo Streda formalism Intrinsic as well as extrinsic contributions to the SHE AHE are treated on equal footing This opened up for the first time the possibility to reliably decompose the SHE AHE into skew and side jump scattering as well as intrinsic contributions in a quantitative manner

Magnetization Dynamics in Pt/Ni₈₀Fe₂₀ Nanowires Induced by Spin Hall Effect Liu Yang, 2015 Spin current is

the flow of electron spin angular momentum It can either be partially spin polarized current generated due to the exchange interactions of spins and local magnetization or pure spin current generated from spin orbit interaction Both sources of spin current are under intensive study for their efficient interaction with nanoscale magnetic structures and potential application of magnetoresistive random access memory MRAM spin torque nano oscillators STNOs and other innovative devices In this dissertation spin Hall effect mediated magnetization dynamics in Platinum Permalloy nanowires are excited by different means and studied experimentally This includes steady state self oscillation of magnetization in a ferromagnetic nanowire serving as the active region of a spin torque oscillator driven by spin orbit torques Our work demonstrates that magnetization self oscillations can be excited in a one dimensional magnetic system and that dimensions of the active region of spin torque oscillators for the first time can be extended beyond the nanometer length scale We also demonstrate that via proper design of the nanowire shape which results in spatial non uniform spin current density we can significantly decrease the phase noise of spin orbit torque oscillators It also stabilizes the single mode generation regime and points out a path for partial control of multi mode excitation in nanostructures We also parametrically excite magnetization dynamics in the nanowires and it demonstrates that nonlinear dynamic magnetic effect can have a larger efficiency than the direct linear excitation in spin Hall structures and it provides additional information about excited spin wave mode systems owing to its threshold nature that is unavailable from direct excitation
