An Empirical Analysis of the Determinants of Long-run Growth and Technical Progress in Southeast Asia Jesus Felipe,1995 This research work is an empirical analysis of the determinants of long run growth and technical progress in five Southeast Asian countries Indonesia Malaysia the Philippines Singapore and Thailand i e the ASEAN countries during the last three decades We ask the fundamental question of why these economies have grown and concentrate on the nature of technical progress behind the growth process We have tested different endogenous growth models and have analyzed whether the determinant of technical progress proposed by each of the models is part of the long run production function The analysis concentrates on the individual countries in an attempt to point out differences in the growth process and in the nature of the technical process associated to it Our empirical findings indicate that an important determinant of long run growth in the ASEAN countries is imports of foreign technology However none of the variables pointed out by recent endogenous growth models i e aggregate capital education government capital expenditures is capable of generating endogenous growth as defined by these models Even the role of exports except in Singapore is not so clear Education exports of machinery and GDP growth are important determinants of TFP growth in all five ASEAN countries and Japanese FDI appears to be particularly important in Singapore We have found complementarity between the level of education and Japanese FDI as well as between the former and imports of machinery However we conclude that none of the determinants analyzed separately is capable of accounting for the growth of these countries and that only a sustained big push package can be responsible for the increase in productivity and growth in the region
