Proceedings of 2nd International Conference on Intelligent Computing and Applications P. Deiva

Sundari, Subhransu Sekhar Dash, Swagatam Das, Bijaya Ketan Panigrahi, 2016-10-12 Second International Conference on Intelligent Computing and Applications was the annual research conference aimed to bring together researchers around the world to exchange research results and address open issues in all aspects of Intelligent Computing and Applications. The main objective of the second edition of the conference for the scientists, scholars, engineers, and students from the academia and the industry is to present ongoing research activities and hence to foster research relations between the Universities and the Industry. The theme of the conference unified the picture of contemporary intelligent computing techniques as an integral concept that highlights the trends in computational intelligence and bridges theoretical research concepts with applications. The conference covered vital issues ranging from intelligent computing, soft computing, and communication to machine learning, industrial automation, process technology, and robotics. This conference also provided a variety of opportunities for the delegates to exchange ideas, applications, and experiences to establish research relations and to find global partners for future collaboration.

Recent Advances in Mobile Robotics Andon Topalov, 2011-12-14 Mobile robots are the focus of a great deal of current research in robotics. Mobile robotics is a young multidisciplinary field involving knowledge from many areas including electrical, electronic, and mechanical engineering, computer, cognitive, and social sciences. Being engaged in the design of automated systems, it lies at the intersection of artificial intelligence, computational vision, and robotics. Thanks to the numerous researchers sharing their goals, visions, and results within the community, mobile robotics is becoming a very rich and stimulating area. The book *Recent Advances in Mobile Robotics* addresses the topic by integrating contributions from many researchers around the globe. It emphasizes the computational methods of programming mobile robots rather than the methods of constructing the hardware. Its content reflects different complementary aspects of theory and practice which have recently taken place. We believe that it will serve as a valuable handbook to those who work in research and development of mobile robots.

Autonomous Navigation in Human Environments Michael F. Everett,2020 Today s robots are designed for humans but are rarely deployed among humans This thesis addresses problems of perception planning and safety that arise when deploying a mobile robot in human environments A first key challenge is that of quickly navigating to a human specified goal one with known semantic type but unknown coordinate in a previously unseen world This thesis formulates the contextual scene understanding problem as an image translation problem by learning to estimate the planning cost to go from aerial images of similar environments The proposed perception algorithm is united with a motion planner to reduce the amount of exploration time before finding the goal In dynamic human environments pedestrians also present several important technical challenges for the motion planning system This thesis contributes a deep reinforcement learning based RL formulation of the multiagent collision avoidance problem with relaxed assumptions on the behavior model and number of agents in the environment Benefits include strong performance among many nearby agents and the ability to accomplish long term autonomy in pedestrian rich environments These and many other state of the art robotics systems rely on Deep Neural Networks for perception and planning However blindly applying deep learning in safety critical domains such as those involving humans remains dangerous without formal guarantees on robustness For example small perturbations to sensor inputs are often enough to change network based decisions This thesis contributes an RL framework that is certified robust to uncertainties in the observation space **Reinforcement-Learning-Based Autonomous Vehicle Navigation in**

Mobile robots are being popular due to their extensive application in different hazardous unapproachable areas such as outer space underwater explorations underground coal mines monitoring inspection in chemical toxic nuclear factories etc The conventional classical robotics may not serve the purpose well if these environments are totally unknown unpredictable even the programmer cannot imagine it In such cases robot learning may be the best option Learning from the past experiences is one such way for real time application of robots for completely unknown environments Reinforcement learning is one of the best learning methods for robots using a constant system environment interaction Both single and multi agent concepts are available for implementation of learning The current research work describes a multi agent based reinforcement learning using the concept of behaviour based robotics for autonomous exploration of mobile robots *Vision Based Autonomous Robot Navigation* Amitava Chatterjee, Anjan Rakshit, N. Nirmal Singh, 2012-10-13 This monograph is devoted to the theory and development of autonomous navigation of mobile robots using computer vision based sensing mechanism The conventional robot navigation systems utilizing traditional sensors like ultrasonic IR GPS laser sensors etc suffer several drawbacks related to either the physical limitations of the sensor or incur high cost Vision sensing has emerged as a popular alternative where cameras can be used to reduce the overall cost maintaining high degree of intelligence flexibility and robustness This book includes a detailed description of several new approaches for real life vision based autonomous navigation algorithms and SLAM It presents the concept of how subgoal based goal driven navigation can be carried out using vision sensing The development concept of vision based robots for path line tracking using fuzzy logic is presented as well as how a low cost robot can be indigenously developed in the laboratory with microcontroller based sensor systems The book describes successful implementation of integration of low cost external peripherals with off the shelf procured robots An important highlight of the book is that it presents a detailed step by step sample demonstration of how vision based navigation modules can be actually implemented in real life under 32 bit Windows environment The book also discusses the concept of implementing vision based SLAM employing a two camera based system *Deep Reinforcement Learning for Target-driven Robot Navigation* Matej Dobrevski, 2023
