

From first law : $Q = \Delta U + W$

$$nC_p \Delta T = nC_v \Delta T + nR \Delta T$$

dividing by $(n \Delta T) \Rightarrow C_p = C_v + R$

or $C_p - C_v = R$ Mayer's formula

Heat supplied (Q) is partly utilised in ΔU and W .

$$\frac{\Delta U}{Q} = \frac{nC_v \Delta T}{nC_p \Delta T} = \frac{C_v}{C_p} = \frac{1}{\gamma}$$

$$\Rightarrow \Delta U = \frac{Q}{\gamma}$$

Work done $W = Q - \Delta U = Q - \frac{Q}{\gamma} = Q \left(1 - \frac{1}{\gamma}\right)$

$$W = Q \left(1 - \frac{1}{\gamma}\right)$$

For monoatomic : $\gamma = \frac{5}{3} \Rightarrow \Delta U = \frac{3}{5} Q, W = \frac{2}{5} Q$

diatomic : $\gamma = \frac{7}{5} \Rightarrow \Delta U = \frac{5}{7} Q, W = \frac{2}{7} Q$

polyatomic : $\gamma = \frac{4}{3} \Rightarrow \Delta U = \frac{3}{4} Q, W = \frac{1}{4} Q$

Modelling, Simulation and Optimization of Industrial Fixed Bed Catalytic Reactors S.S.E.H. Elnashaie, 2022-01-26 In the last two decades impressive advances have been made toward the understanding and quantitative description of the kinetics

Despite these advances however the use of mathematical modelling of gas solid catalytic reactors in industry is still limited. By consolidating progress in the understanding of catalytic processes this book applies these fundamental advances to the development of models for design simulation and optimization of industrial reactors. Paying particular attention to the verification of the developed models against industrial data these models are used to optimize the performance of many practical reactor cases. Using a systems approach for the development of the different components and the resulting overall models the book is easy to read and gives an insight into the behaviour of these complex industrial systems. In addition the practical relevance of bifurcation instability and chaos to industrial reactors is briefly discussed.

Sterilization of Food in Retort Pouches A.G. Abdul Ghani Al-Baali, Mohammed M. Farid, 2007-11-12 Sterilization of canned food is a well known technology that has been in practice for many decades. Food sterilization has been well studied in a large number of textbooks. This book is not about the science of sterilization or food safety but rather about the important interaction between fluid mechanics, heat transfer and microbial inactivation. Such interaction is complex and if ignored would lead to incorrect information not only on food sterility but also on food quality. The book is written by engineers for both food engineers and scientists. However it may also be of interest to those working in computational fluid dynamics (CFD). It presents an elementary treatment of the principles of heat transfer during thermal sterilization and it contains sufficient material presented at a high level of mathematics. A background in the solution of ordinary and partial differential equations is helpful for proper understanding of the main chapters of this book. However we have avoided going into a detailed numerical analysis of the finite volume method (FVM) of solutions used to solve the sets of equations. Some familiarity with fluid dynamics and heat transfer will also be helpful but not essential. In this book conduction and convective heat transfer is treated such that the reader is offered the insight that is gained from analytical solutions as well as the important tools of numerical analysis which must be used in practice. Analysis of free convection is used to present a physical picture of the convection process.

University of Colorado Bulletin, 1954 **Thermodynamic Approaches in Engineering Systems** Stanislaw Sieniutycz, 2016-05-20 Thermodynamic Approaches in Engineering Systems responds to the need for a synthesizing volume that throws light upon the extensive field of thermodynamics from a chemical engineering perspective that applies basic ideas and key results from the field to chemical engineering problems.
