*A Knowledge-based Deformable Surface Model for Analysis of Medical Images* Amir Ghanei, 2001 Medical images are challenging for segmentation Deformable models proved to be one of the most effective tools for this purpose however they still have several shortcomings and face several problems when used for images with objects that have low contrast multiple edges of other objects in their vicinity or do not have a continuous boundary in the image They also suffer in general from problems such as initialization self cutting and concave shape In this research we developed and implemented a two dimensional 2D and three dimensional 3D deformable model for analysis of medical images We used the 2D deformable model to segment structures with low contrast and multiple or discontinuous edges To do this we developed an edge tracking algorithm for external forces adaptive force weights and interpolation of energies We further developed a 2D warping model that uses this deformable contour to extract the boundaries and create a mesh map in each image using equidistance contours Thin plate splines or inverse distance weights are used for interpolation between the mesh map grids We developed a 3D deformable surface model as the extension of the deformable contour to 3D The model has a closed discrete structure based on polygonal facets We developed a method based on LSE estimation of Dupin indicatrix to calculate internal forces and use gradient based operator for external forces We remedy self cutting by extracting principal axis and performing reslicing followed by triangulation of the model We propose a

method for creating the initial surface from the individual 2D contours and use multi resolution and resampling of the surface and re triangulation to further improve the model deformation The model is initialized using a rule based expert system We extended the 2D warping model to 3D The developed models have been used in several challenging applications among which segmentation of hippocampus from brain MRI and prostate from ultrasound images and the warping have been extensively investigated Comparison to manual results shows excellent model performance **Inform** ,1993 The magazine of information and image management **Intelligent Systems and Automation** Hichem Arioui,Rochdi Merzouki,Hadj Ahmed Abbassi,2008-06-17 All papers have been peer reviewed The Intelligent Systems and Automation conference will be organized for its first edition between June 30th and July 02nd 2008 where it will be held at Annaba in Algeria Africa CISA encourages the diverse research actors and the industrial one to present the last headways in Robotics and Automation fields notably the experimental demonstration of prototypes CISA tries to give to the unsupported researchers a significant access to the new technologies and theories around the topics of Robotics Automation The organizers want to give the necessary scientific documents to disposal of the PhD students and researchers of the Mediterranean region CISA wants to offer to the youth researchers from the south Mediterranean region the opportunities to exchange and to discuss their scientific contributions with the other researchers from all over the world **Handbook of Image Processing Operators** Reinhard Klette,Piero Zamperoni,1996-05-09 Handbook of Image Processing Operators Reinhard Klette Berlin Technical University Germany Piero Zamperoni Braunschweig Technical University Germany The practical applications of digital image processing have expanded significantly in recent years Interest is increasing over a wide range of disciplines from computer vision to biomedical imaging and mechanical inspection An invaluable reference source for all who work in image processing this text describes the complete range of standard image processing operators and transformations Coverage spans the fundamentals of image processing introducing the basic terminology describing the general control structures and illustrating a range of algorithmical procedures The major strength of this book lies in its practical approach offering the user operative solutions to a broad range of specific application problems in image analysis image enhancement and feature extraction To this end it serves as a reference to select the most suitable operators for any given problem After the introductory chapters each operator is presented in the same form characterization mathematical definition comments and algorithmic aspects pseudo program and bibliographic references An indispensable guide for computer applications engineers at a professional academic or research level in communications natural sciences medicine and robotics who have to solve field specific application problems using advanced digital image processing techniques The source codes for all the operators described in the text are available on disk for UNIX and MS DOS systems see inside for details
