Cheng, Ching-shyang Chen, Andreas Karageorghis, 2025-03-11 Over the past two decades the method of fundamental solutions MFS has attracted great attention and has been used extensively for the solution of scientific and engineering problems The MFS is a boundary meshless collocation method which has evolved from the boundary element method In it the approximate solution is expressed as a linear combination of fundamental solutions of the operator in the governing partial differential equation One of the main attractions of the MFS is the simplicity with which it can be applied to the solution of boundary value problems in complex geometries in two and three dimensions The method is also known by many different names in the literature such as the charge simulation method the de singularization method the virtual boundary element method etc Despite its effectiveness the original version of the MFS is confined to solving boundary value problems governed by homogeneous partial differential equations To address this limitation we introduce various types of particular solutions to extend the method to solving general inhomogeneous boundary value problems employing the method of particular solutions This book consists of two parts Part I aims to provide theoretical support for beginners In the spirit of reproducible research and to facilitate the understanding of the method and its implementation several MATLAB codes have been included in Part II This book is highly recommended for use by post graduate researchers and graduate students in scientific computing and engineering Solutions Manual for a Theoretical Introduction to Numerical Anal Ryaben'kii Victor S Staff, 2008-01-03

An Efficient, Accurate Numerical Method for the Solution of a Poisson Equation on a Sphere Samuel Y. K. Yee,1977 The need for efficient and accurate methods for the solution of boundary value problems such as Poisson type equations is well established In numerical weather prediction where solutions to such equations are required in daily routine operations it is paramount that the solution procedure be efficient An efficient shooting method to meet such a need has been reported The algebraic system resulting from the regular discretization of the Poisson equation on a sphere is however numerically unstable Thus the direct application of this method is accurate only for relatively small systems This limitation has now been successfully removed by two major improvements to the method The inherent instability of the system due to a spectral radius larger than unity is alleviated by the use of a multiple shooting technique while the instability due to the convergence of meridians on a sphere is overcome by a specially designed flexible grid Numerical examples are provided to demonstrate the effectiveness of the improved method
