El-Halwagi,2006-04-06 With growing global competition the process industries must spare no effort in insuring continuous process improvement in terms of Increasing profitability Conservation of resources and Prevention of pollution The question is how can engineers achieve these goals for a given process with numerous units and streams Until recently conventional approaches to process design and operation put emphasis only on individual units and parts of the process A more powerful integrated approach was lacking The new field of Process

Integration looks towards the processing plant as a whole in its attempt to find solutions and improvements Research over the past two decades has resulted in many techniques that allow engineers to better understand complex facilities and significantly enhance their performance This textbook presents a comprehensive and authoritative treatment of the concepts tools and applications of Process Integration Emphasis is given to systematic ways of analyzing process performance Graphical algebraic and mathematical procedures are presented in detail In addition to covering the fundamentals of the subject the book also includes numerous case studies and examples that illustrate how Process Integration is solving actual industrial problems Systematic methodology for analyzing the process as an integrated system identifying global insights of the process and generating optimum strategies and solutions Proper mix of fundamental principles insightful tools and industrial applications Generic techniques that are applicable to a wide variety of processing facilities Packed with case studies practical tools charts tables and performance criteria Extensive bibliography to provide ready access to process integration literature Excellent review of state of the art technology development trends and future research directions

Modeling and Control in Air-conditioning Systems Ye Yao, Yuebin Yu, 2016-10-01 This book investigates the latest modeling and control technologies in the context of air conditioning systems Firstly it introduces the state space method for developing dynamic models of all components in a central air conditioning system The models are primarily nonlinear and based on the fundamental principle of energy and mass conservation and are transformed into state space form through linearization The book goes on to describe and discuss the state space models with the help of graph theory and the structure matrix theory Subsequently virtual sensor calibration and virtual sensing methods which are very useful for real system control are illustrated together with a case study Model based predictive control and state space feedback control are applied to air conditioning systems to yield better local control while the air side synergic control scheme and a global optimization strategy based on the decomposition coordination method are developed so as to achieve energy conservation in the central air conditioning system Lastly control strategies for VAV systems including total air volume control and trim response static pressure control are investigated in practice
