Cognitive Rehabilitation in Dementia Linda Clare, Robert T. Woods, 2001. The relevance of cognitive rehabilitation for people with dementia is becoming increasingly accepted by researchers and practitioners in the field. This special issue draws together examples of state-of-the-art research and systematic review by experts in this exciting and growing area. The contributors show how cognitive rehabilitation approaches can be applied in different ways to help optimise functioning and address specific difficulties across the full spectrum of severity. While the main focus is on the more commonly diagnosed forms of dementia, treatment possibilities for people with fronto-temporal dementia are also explored. Cognitive rehabilitation interventions need to be grounded in a clear assessment of the profile of strengths and limitations in cognitive functioning and to demonstrate where possible that treatment effects extend beyond improvement on target measures to have a meaningful impact on wellbeing and quality of life. For this reason, the special issue includes contributions that explore detailed aspects of cognitive functioning or describe new developments in evaluating quality of life in dementia. Cognitive rehabilitation, it is suggested, should be viewed as one important component of a holistic approach to helping people with dementia, their families, and those who care for them. This special issue seeks both to provide information about what has already been achieved and to encourage and stimulate further progress.

The Cognitive Neuroscience of Memory Howard Eichenbaum, 2002 This clear and accessible textbook introduces students to the brain's remarkable capacity for memory It begins with a history of thinking and research on the biological bases of memory highlighting discoveries about the brain made in a Golden Era of neuroscience around the turn of the 20th century This is followed by presentation of our current understanding of the neurobiology of memory organized into sections corresponding to the book's four major themes The first is Connection and it considers how memory is based on alterations in the communication between nerve cells Research on the physiology and biochemistry of neurons has revealed a cascade of molecular events and structural changes that enhance or weaken the connectivity of nerve cells in support of memory The second theme is Cognition which considers the psychological structure of memory Early work on this topic involved controversy over the basic cognitive processes that underlie memory and modern research has shown that these characterizations reflect distinctions among qualitatively different forms of memory The third theme is Compartmentalization the notion that the different forms of memory are accomplished by distinct brain systems Recent research has revealed parallel memory systems that separately mediate our ability for conscious recollection our capacity to acquire skills and habits and our acquisition of emotional attachments and aversions The fourth theme is Consolidation the process by which

memories are transformed from a labile trace into a permanent store Scientists have shown that there are two distinct stages in memory consolidation one involving cellular mechanisms that underlie a fixation of changes in the neuronal connection strengths and the other involving a reorganization and reconstruction of the circuits that store and retrieve memories The book assumes little background knowledge from biology or psychology and is intended as a text for use in undergraduate courses on memory and cognitive science and for early graduate students in neuroscience cognitive science or biology It encapsulates the major concepts in the field and makes this area of research accessible to students who pursue a variety of related disciplines
