**Manufacturing Systems Modeling and Analysis** Guy L. Curry, Richard M. Feldman, 2010-11-10 This text presents the practical application of queueing theory results for the design and analysis of manufacturing and production systems This textbook makes accessible to undergraduates and beginning graduates many of the seemingly esoteric results of queueing theory In an effort to apply queueing theory to practical problems there has been considerable research over the previous few decades in developing reasonable approximations of queueing results This text takes full advantage of these results and indicates how to apply queueing approximations for the analysis of manufacturing systems Support is provided through the web site <http://msma.tamu.edu> Students will have access to the answers of odd numbered problems and instructors will be provided with a full solutions manual Excel files when needed for homework and computer programs using Mathematica that can be used to solve homework and develop additional problems or term projects In this second edition a separate appendix dealing with some of the basic event driven simulation concepts has been added

technological book is written and published for one of two reasons it either renders some other book in the same field obsolete or breaks new ground in the sense that a gap is filled The present book aims to do the latter On my return from industry to an academic career I started writing this book because I had seen that a gap existed Although a great deal of information appeared in the published literature about various technical aspects of advanced manufacturing technology AMT surprisingly little had been written about the systems context within which the sophisticated hardware and software of AMT are utilized to increase efficiency Therefore I have attempted in this book to show how structured approaches in the design and evaluation of modern manufacturing plant may be adopted with the objective of improving the performance of the factory as a whole I hope this book will be a contribution to the newly recognized multidisciplinary engineering function known as manufacturing systems engineering The text has been designed specifically to demonstrate the systems aspects of modern manufacturing operations including systems concepts of manufacturing operation manufacturing systems modelling and evaluation and the structured design of manufacturing systems One of the major difficulties associated with writing a text of this nature stems from the diversity of the topics involved I have attempted to solve this problem by adopting an overall framework into which the relevant topics are fitted
