Antennas with Non-Foster Matching Networks James T. Aberle, Robert Loepsinger-Romak, 2007 Most antenna engineers are likely to believe that antennas are one technology that is more or less impervious to the rapidly advancing semiconductor industry However as demonstrated in this lecture there is a way to incorporate active components into an antenna and transform it into a new kind of radiating structure that can take advantage of the latest advances in analog circuit design The approach for making this transformation is to make use of non Foster circuit elements in the matching network of the antenna By doing so we are no longer constrained by the laws of physics that apply to passive antennas However we must now design and construct very touchy active circuits This new antenna technology is now in its infancy The contributions of this lecture are 1 to summarize the current state of the art in this subject and 2 to introduce some new theoretical and practical tools for helping us to continue the advancement of this technology
