

Weathering, Erosion and Deposition

O: We will study deposition, weathering, and erosion.

weathering - is a process that breaks down rock and other substances at Earth's surface

- very slow process
- creates soil
- softer rock weathers faster
- weathering is fastest in hot and wet climates

mechanical weathering - breakdown of rock into smaller pieces without any change in the chemical composition of its minerals.

- **ice wedging** - occurs when water fills cracks in rock then freezes and thaws over a long period of time. The expanding ice cause the rock to eventually break.
- **exfoliation** - rock breaks off into leaves or sheets along joints which are parallel to the ground surface.
- **thermal weathering** - rock split by daily heating and cooling as different minerals in the rock expand and contract.
- **biotic weathering** - weathering caused by living organisms

One rock has a softer chalkier surface and the other has a smooth, hard surface.

chemical weathering - breakdown of rock into smaller pieces because of change in the chemical composition of its minerals.

- **oxidation** - oxygen combines with elements in rocks to form new types of rock. Often, there is a rusting effect on the rock.
- **hydrolysis** - water combines with the substances in rocks to form new types of rock.
- **carbonation** - carbon dioxide is dissolved in water making carbonic acid, which eats away at the rock.
