Cook,2013-10-09 Flight dynamicists today need not only a thorough understanding of the classical stability and control theory of aircraft but also a working appreciation of flight control systems and consequently a grounding in the theory of automatic control In this text the author fulfils these requirements by developing the theory of stability and control of aircraft in a systems context The key considerations are introduced using

dimensional or normalised dimensional forms of the aircraft equations of motion only and through necessity the scope of the text will be limited to linearised small perturbation aircraft models The material is intended for those coming to the subject for the first time and will provide a secure foundation from which to move into non linear flight dynamics simulation and advanced flight control Placing emphasis on dynamics and their importance to flying and handling qualities it is accessible to both the aeronautical engineer and the control engineer Emphasis on the design of flight control systems Intended for undergraduate and postgraduate students studying aeronautical subjects and avionics systems engineering control engineering Provides basic skills to analyse and evaluate aircraft flying qualities Integration of Fire Control, Flight Control and Propulsion Control Systems ,1983 NASA SP. ,1992 High Resolution Simulation of Full Aircraft Control at Flight Reynolds Numbers ,2007 This paper documents interim results of a three year project to develop a computational method for accurately determining static and dynamic stability and control characteristics of fighter and transport aircraft with various store configurations as well as the aircraft response to pilot input In this second year of the project computational data is gathered for a rigid F 16C with no control surface movement in forced motion that approximates flight test maneuvers Computational maneuvers designed to efficiently gather three axes of motion data to build a comprehensive reduced order model are also developed The data is then post processed to determine the resulting static and dynamic stability characteristics The main benefits of this effort are 1 early discovery of complex aerodynamic phenomena that are typically only present in dynamic flight maneuvers and therefore not discovered until flight test and 2 rapid generation of an accurate aerodynamic data base to support aircraft and weapon certification by reducing required flight test hours and complementing current stability and control testing **Government Reports Announcements & Index** ,1988
