Micro And Macro Environment Population And The:

The Spatial Scale of Crime John R. Hipp, 2022-12-09 Combining insights from two distinct research traditions the communities and crime tradition that focuses on why some neighborhoods have more crime than others and the burgeoning crime and place literature that focuses on crime in micro geographic units this book explores the spatial scale of crime Criminologist John Hipp articulates a new theoretical perspective that provides an individual and household level theory to underpin existing ecological models of neighborhoods and crime A focus is maintained on the agents of change within neighborhoods and communities and how households nested in neighborhoods might come to perceive problems in the neighborhood and then have a choice of exit voice loyalty or neglect EVLN A characteristic of many crime incidents is that they happen at a particular spatial location and a point in time These two simple insights suggest the need for both a spatial and a longitudinal perspective in studying crime events The spatial question focuses on why crime seems to occur more frequently in some locations than others and the consequences of this for certain areas of cities or neighborhoods The longitudinal component focuses on how crime impacts and is impacted by characteristics of the environment This book looks at where offenders targets and guardians might live and where they might spatially travel throughout the environment exploring how vibrant neighborhoods are generated how neighborhoods change and what determines why some neighborhoods decline over time while others avoid this fate Hipp s theoretical model provides a cohesive response to the general question of the spatial scale of crime and articulates necessary future directions for the field This book is essential for students and scholars interested in spatial temporal criminology

Under Optimal and Suboptimal Environments for Body Weight in Chicken Using a Diallel Mating System

Mohamed Hanafi Sayed Mahmoud,1966 A 2 x 2 x 2N confounded diallel mating design 2 series 2 males N females per male per series was used to obtain estimates of the genetic parameters in body weight traits in a noninbred population of New Hampshire chickens grown on 18% and 24% protein rations Individual selection also was applied to evaluate the reliability of the genetic parameters obtained under each protein level The analysis showed an extremely large contribution of series effects to the total variation in the traits which was attributed to the environmental influences from one series to the other and to the maternal environment The component of variance due to series x male interaction was found to be small or zero under the 24% protein ration An optimal environment may have given certain genotypes a greater opportunity to adapt to the environment The higher estimates of the component of variance of series x female interaction for one day body weight suggests the influence of maternal effects from one series to the other and from one dam to the other Generally estimates for

the component of variance of male effects were higher under the 18% protein ration than under the 24% protein ration Conversely the component of variance of female effects showed higher values under the 24% protein ration than under 18% protein ration for most of the traits considered *Man and Environment* Surajit Sinha,Arabinda Basu,Amitabha Basu,1989
