[Electric Vehicles and the Future of Energy Efficient Transportation](#) Subramaniam, Umashankar,Williamson, Sheldon S.,Krishna S., Mohan,J. L., Febin Daya,2021-04-16 The electric vehicle market has been gradually gaining prominence in the world due to the rise in pollution levels caused by traditional IC engine based vehicles The advantages of electric vehicles are multi pronged in terms of cost energy efficiency and environmental impact The running and maintenance cost are considerably less than traditional models The harmful exhaust emissions are reduced besides the greenhouse gas emissions when the electric vehicle is supplied from a renewable energy source However apart from some Western nations many developing and underdeveloped countries have yet to take up this initiative This lack of enthusiasm has been primarily attributed to the capital investment required for charging infrastructure and the slow transition of energy generation from the fossil fuel to the renewable energy format Currently there are very few charging stations and the construction of the same needs to be ramped up to supplement the growth of electric vehicles Grid integration issues also crop up when the electric vehicle is used to either do supply addition to or draw power from the grid These problems need to be fixed at all the levels to enhance the future of energy efficient transportation [Electric Vehicles and the Future of Energy Efficient Transportation](#) explores the growth and adoption of

Dynamic Systems Modeling of Lithium Ion Battery Systems

in MATLAB Inclusive of Temperature Dependency Joshua Savitz, 2017 In order to design a battery system to be used in an electric vehicle dynamic battery system models must be created to understand the complex performance of the system when loaded with varying discharge profiles and in various temperature environments In this way prototyping of the battery systems is partially replaced by simulations that predict the performance instead of battery testing In this thesis performance models were created based on system geometry ambient temperature and current profile to track the runtime voltage output and cell temperature accurately of individual cells and of the system as a whole A single cell 6 cells in series and a parallel set of 6 cell in series in each branch geometries are analyzed at 0C 23C and 35C with a constant pulsed and constant with pulsed current profiles An equivalent circuit model with 1 RC pair inclusive of temperature dependency is hence utilized for the single cell model and then will be implemented into battery system configurations The focus is put on ambient temperature rather than discharge rate so the model parameters are set as functions of state of charge and ambient temperature and found through a parameter estimation conducted within MATLAB Simulink This simple equivalent circuit model captures the dynamic processes happening within the cell s but not to the extent it could with a 2 RC pair model Experimental tests were conducted to derive the model parameters and validate the models The accuracy achieved in the prediction of voltage output within the single cell model is around 50mV which was the initially determined tolerance for max error The multi cell battery system models and thermal models had large amounts of error

Recent Advances in Mechanical Engineering Balaguru Sethuraman, Pushpdant Jain, Manoj Gupta, 2023-07-24 This book consists of select proceedings of the 1st International Conference on Sustainable Technologies and Advances in Automation Aerospace and Robotics STAAAR 2022 This book focuses on advancements in the fields of robotics and automation applications of AI aerodynamics computational fluid dynamics material characterization renewable energy computer aided engineering design rapid prototyping aerospace engineering and dynamics and vibrations The major topics in the book include Industry 4 0 applications of additive manufacturing in biomedical automotive and aviation industries implants and prosthesis applications in human body applications of latest technologies such as machine learning IoT static and dynamic balancing force transmissibility advanced mechanisms etc This book provides vital information to researchers academicians and industrialists to enhance their knowledge in the field of recent advancements in the field of mechanical engineering
