

Provisions for assessment of existing structures in the second-generation concrete Eurocode

Craig Cicco examines ways in which the second-generation of Eurocode 2 will facilitate the assessment of existing concrete-framed structures.

EN 1992-1-1 (2004) (code of design of concrete structures) includes additional provisions that enable it to be used for assessment of existing structures. This article outlines some of these provisions, which are likely to be of assistance when using Eurocode 2 to assess concrete-framed structures. These include:

- determining characteristic material properties for assessment
- adjusting design loads or factors where testing is used to determine material properties
- determining values of deterioration
- load lifting force and anchorage lengths of bar ends
- dealing with existing structural defects in the parent structure
- using gross cross-sections for assessment of their resistance.

Material properties

EN 1992-1-1 (2004) requires characteristic values of material properties to assess the material properties. Annex E provides guidance for how users to obtain relevant values for assessment. It introduces use of **EN 1992-1-1 (2004)** to determine the self-characteristic concrete strength from testing. It provides a range of factors to adjust to determine f_{ck} from f_{ctd} making some provision for situations where testing cannot be completed at the region being assessed. Additional

information is provided in the standard to enable characteristic values of self strength or characteristic compressive to be determined from testing should steel grades used in the structure can be available from relevant information.

The UK National Annex committee is presently reviewing this factor for determining f_{ck} from f_{ctd} . It may require some adjustments to the characteristic values to assess agreement with values obtained from **EN 1992-1-1 (2004)** and the UK National Annex, taking into account the ability to adjust design factors for material in Annex A of the new standard. It may also consider different methods of determining f_{ck} from f_{ctd} where gross concrete cross-sections and the region being assessed, such as using the results of laboratory tests have calibrated inter-daily tests, along with relevant provisions in **EN 1992-1-1 (2004)**.

Partial material factors

Annex E of the new standard provides new guidance for using partial material factors to be adjusted based on material test results from the structure. This should generally reduce the value of these factors, when a low coefficient of variation of material strength is obtained from testing, which is beneficial for assessed members.

members. The standard permits test data available from records to also be used where suitable and appropriate.

Deterioration

Provision is made for deterioration of concrete, which is generally an issue. The rest of the standard has to take all issues associated with deterioration, but in assessing members for global types of deterioration and their impact. It also clearly provides guidance on when assessment in accordance is likely to affect the presence of the test.

Plain bars

Plain bars were not covered in **EN 1992-1-1 (2004)**. The standard introduces this into the Eurocode, which is covered by concrete structures. The provisions are based on a new extended-member test of plain bars that was developed during the drafting of the standard (Pohlmann et al.). The provisions also cover the variation of load resulting from subtle steel bars.

Provision is made for members that are subject to compression forces of arbitrary lengths under uniform and these provisions in other circumstances. Other established methods of assessing the bond of plain bars are available in the UK, including those listed by National Highway (2004). These may more closely with Eurocode provisions in **EN**
