Modeling The Acoustic Transfer Function Of A Room:

Uncertainties in Acoustical Transfer Functions Pascal Dietrich, 2013 Measured transfer functions of acoustic systems are often used to derive single number parameters The uncertainty analysis is commonly focused on the derived parameters but not on the transfer function as the primary quantity This thesis presents an approach to assess the uncertainty contributions in these transfer functions by using analytic models Uncertainties caused by the measurement method are analyzed with a focus on the underlying signal processing In particular the influence of nonlinearities in the acoustic measurement chain are modeled to predict artifacts in the measured signals and hence the calculated acoustic transfer function Secondly characterization methods commonly applied in the field of signal processing are linked to the acoustic scenarios and the main influencing parameters Acoustic parameters are then derived analytically and by means of Monte Carlo simulations considering the uncertainty of these input parameters In order to provide airborne applications analytic models for sound barrier and room acoustic measurements are developed incorporating the directivity and the orientation of the sound source as well as the positions of sources and receivers The simulated uncertainty contributions are validated by measurements The same approach is also applied to structure borne sound applications

Advances in Sound Localization Pawel Strumillo, 2011-04-11 Sound source localization is an important research field that has attracted researchers efforts from many technical and biomedical sciences Sound source localization SSL is defined as the determination of the direction from a receiver but also includes the distance from it Because of the wave nature of sound propagation phenomena such as refraction diffraction diffusion reflection reverberation and interference occur The wide spectrum of sound frequencies that range from infrasounds through acoustic sounds to ultrasounds also introduces difficulties as different spectrum components have different penetration properties through the medium Consequently SSL is a complex computation problem and development of robust sound localization techniques calls for different approaches including multisensor schemes null steering beamforming and time difference arrival techniques The book offers a rich source of valuable material on advances

on SSL techniques and their applications that should appeal to researches representing diverse engineering and scientific disciplines
