Abstract Myasthenia gravis (MG) is an autoimmune antibody-mediated disorder of neuromuscular synaptic transmission. The clinical hallmark of MG consists of fluctuating fatigability and weakness affecting ocular, bulbar and (proximal) limb skeletal muscle groups. MG may either occur as an autoimmune disease with distinct immunogenetic characteristics or as a paraneoplastic syndrome associated with tumors of the thymus. Impairment of central thymic and peripheral self-tolerance mechanisms in both cases is thought to favor an autoimmune CD4⁺ T cell-mediated B cell activation and synthesis of pathogenic high-affinity autoantibodies of either the IgG1 and 3 or IgG4 subclass. These autoantibodies bind to the nicotinic acetylcholine receptor (AChR) itself, or muscle-specific tyrosine-kinase (MuSK), lipoprotein receptor-related protein 4 (LRP4) and agrin involved in clustering of AChRs

within the postsynaptic membrane and structural maintenance of the neuromuscular synapse. This results in disturbance of neuromuscular transmission and thus clinical manifestation of the disease. Emphasizing evidence from clinical trials, we provide an updated overview on immunopathogenesis, and derived current and future treatment strategies for MG divided into: (a) symptomatic treatments facilitating neuromuscular transmission, (b) antibody-depleting treatments, and (c) immunotherapeutic treatment strategies.

Introduction

Myasthenia gravis (MG) is regarded an autoimmune antibody-mediated disorder of neuromuscular synaptic transmission as (a) auto-antibody depositions are detectable at the neuromuscular junction (NMJ) [175, 176]; (b) autoantibodies from MG patients cause MG symptoms when

This manuscript has partially been adopted from the clinical guidelines “Diagnostik und Therapie der Myasthenia gravis und des Lambert-Eaton-Syndroms” of the German Neurological Society (DGN) published by some of the authors [44]. Publication has been permitted by the German Neurological Society.

Assessment of Hypertensive Organ Damage Lennart Hansson, W. H. Birkenhäger, 1997 Hardbound A recent wave of interest in practical hypertension research relates to the evaluation of organ damage in connection with the hypertensive process A large number of prognostic therapeutic trials in hypertensive populations has convincingly shown that antihypertensive treatment per se substantially improves the cardiovascular prospects of such patients This particularly applies to cerebrovascular accidents which are the most dramatic events from any point of view It should be recognized that the identification of all cardiovascular sequelae thus far focused on conventional clinical pathological criteria and hence lacked quantitative evaluation The currently available techniques of identifying early organ lesions may well exonerate hypertensive patients from being exposed to avoidable and irreversible cardiovascular risk because they pinpoint early quantifiable hypertensive retinal cerebral cardiac and renal lesions Given the current
