

The Rectilinear Motion

Rectilinear motion is a physics concept that describes the displacement of an object in a straight line, without a change in direction.

In this type of motion, the trajectory is a straight line, and the velocity can be either constant or variable. Parameters such as position, velocity, and acceleration are studied as functions of time.

Understanding **rectilinear motion** is essential for grasping basic principles of kinematics. It is applied in classical mechanics to simplify the description of movements in experimental settings or practical applications, providing a foundational understanding of motion in a linear context.
