Sports Research with Analytical Solution using SPSS J. P. Verma, 2016-03-31 A step by step approach to problem solving techniques using SPSS in the fields of sports science and physical education. Featuring a clear and accessible approach to the methods, processes, and statistical techniques used in sports science and physical education. *Sports Research with Analytical Solution using SPSS* emphasizes how to conduct and interpret a range of statistical analysis using SPSS. The book also addresses issues faced by research scholars in these fields by providing analytical solutions to various research problems without reliance on mathematical rigor. Logically arranged to cover both fundamental and advanced concepts, the book presents standard univariate and complex multivariate statistical techniques used in sports research, such as multiple regression analysis, discriminant analysis, cluster analysis, and factor analysis. The author focuses on the treatment of various parametric and nonparametric statistical tests, which are shown through the techniques and interpretations of the SPSS outputs that are generated for each analysis. *Sports Research with Analytical Solution using SPSS* also features numerous examples and case studies to provide readers with practical applications of the analytical concepts and techniques. Plentiful screen shots throughout help demonstrate the implementation of SPSS outputs. Illustrative studies with simulated realistic data clarify the analytical techniques covered. End of chapter short answer questions, multiple choice questions, assignments, and practice exercises help build a better understanding of the presented concepts. A companion website with associated SPSS data files and PowerPoint presentations for each chapter. *Sports Research with Analytical Solution using SPSS* is an excellent textbook for upper undergraduate, graduate, and PhD level courses in research methods, kinesiology, sports science, medicine, nutrition, health education, and physical education. The book is also an ideal reference for researchers and professionals in the fields of sports research, sports science, physical education, and social sciences, as well as anyone interested in learning SPSS.

Multidimensional NMR Methods for the Solution State Gareth A. Morris, James W. Emsley, 2012-12-19 The content of this volume has been added to eMagRes, formerly Encyclopedia of Magnetic Resonance, the ultimate online resource for NMR and MRI. The literature of multidimensional NMR began with the publication of three papers in 1975, then nine in 1976, and fifteen in 1977, and now contains many tens of thousands of papers. Any attempt to survey the field must therefore necessarily be very selective, not to say partial. In assembling this handbook, the Editors have

sought to provide both the new researcher and the established scientist with a solid foundation for the understanding of multidimensional NMR a representative if inevitably limited survey of its applications an authoritative account of classic techniques such as COSY NOESY and TOSCY and an account of the latest progress in the development of multidimensional techniques This handbook is structured in four parts The first opens with an historical introduction to and a brief account of the practicalities and applications of multidimensional NMR methods followed by a definitive survey of their conceptual basis and a series of articles setting out the generic principles of methods for acquiring and processing multidimensional NMR data In the second part the main families of multidimensional techniques arranged in approximate order of increasing complexity are described in detail from simple J resolved spectroscopy through to the powerful heteronuclear 3D and 4D methods that now dominate the study of structural biology in solution The third part offers an illustrative selection from the very wide range of applications of multidimensional NMR methods including some of the most recent developments in protein NMR Finally the fourth part introduces the idea of multidimensional spectra containing non frequency dimensions in which properties such as diffusion and relaxation are correlated
