**Allowing Distributed Generation to Improve Power System Stability by Applying Virtual Synchronous Machine Approach** Mohamed M. Abuagreb,2020 The installed power capacity of DG is increasing many of distributed generators are connected to a grid by inverters The DC AC inverters are controlled by a Phase Locked Loop PLL so they can be synchronized with power system frequency If this capacity becomes larger the grid power system become unstable because the inverter is controlled to follow the power grid frequency Performance of a photovoltaic generation PV plant with an integrated battery energy storage system BESS is examined under different system conditions Although the penetration of distributed renewable energy sources into the traditional grid has risen over the past decade the potential negative impact of this integration can never be overemphasized The proposed scheme is evaluated in system studies under fluctuating levels of solar irradiation related to the weather conditions As the changes in irradiation and temperature occur the dc link voltage changes due to the changes in power produced the inverter ac power is controlled to regulate the dc voltage This research models are energy management system which is based on a hysteresis control algorithm for the battery which limits the abrupt charging discharging of the battery thus increasing battery lifespan which also compensating for change in PV output and power system conditions The PV source does not have significant energy storage However it can supply small quantity of energy for the grid system because it has dc capacitor located in the dc link Separate energy storage such as a battery can work with a PV source to supply energy for the frequency control In addition with increasing penetration of the inverter based power generation there is decrease in inertia due to the fast frequency tracking of the PLL which speed up dynamic behavior and stability problems on the power grid To mitigate this problem the integration of virtual synchronous generators VSG based on the photovoltaic PV generation plus energy storage is proposed This research implemented the VSG control based on the swing equation model of a synchronous generator The VSG can be designed to aid the integration of large scale photovoltaic generation into the power grid Through this concept it is plausible for the DG to exhibit the characteristics and behavior of synchronous generators SG such as inertia behaviour droop functions and damping These factors make it possible for the PV to contribute to the control and stability of the power grid The work also presents a proposed a simple

method calculating approximate for approximating battery sizing with respect to power and energy by providing emulation inertia in order to meet the target system inertia and power frequency characteristics Three cases were simulated in order to calculate the amount of the battery energy sizing needed to support the power grid inertia which reduces the rate of change of frequency deviation These models are designed and simulated in the electromagnetic alternate transients program ATP to simulate the power system The power grid is testing with the ATP program and validated with powerworld simulator
