Handover and Cell Reselection Study in LTE Marta Coll Muñoz, 2011 ANGL S In LTE the handover is a hard handover the UE is first connected to the source eNodeB then it gets unattached to the network to connect again to the target eNodeB This procedure is not fail safe and may cause a call drop In this project the influence of some handover related parameters such as hysteresis margin Time to Trigger antenna configuration route trajectory and UE parameters is studied to show their impact in the handover performance Simple synthetic scenarios are simulated to evaluate the effect of each parameter on the handover procedure With this analysis we obtain the worst handover conditions for simple scenarios A method to study handovers in a 3D city model is developed using a deterministic prediction tool Ray Tracing With this method we identify problematic areas for handovers inside a real city Finally with the technique developed here some routes in this city with possible call drops due to bad handovers are selected and examined in more detail This study can help operators optimizing their network deployments and also help chip vendors to know in which handover problematic areas their devices can be tested

Analysis of Handover Based on the Use of Femtocells in LTE Networks Ketyllen Silva, Carlos Francês, 2015-08-28 The volume of data traffic in mobile networks is growing exponentially The explosion of mobile devices and applications in recent years has led to an overload of the network infrastructure responsible for disposing of this traffic thus affecting the performance of the network as the user experience One of the key elements in the networks LTE Long Term Evolution is the possibility of deploying multiple femtocells for the improvement of coverage and data rate However arbitrary overlapping coverage of these cells makes the handover mechanism complex and challenging Thus this book proposes a methodology to study the impact of handover in LTE networks with femtocells From a discrete simulation approach the effects of the deployment of femtocells were evaluated This study aimed to measure the impact and correlation of the use of femtocell parameters of QoS Quality of Service and performance indicators handover

Network Performance and Fault Analytics for LTE Wireless Service Providers Deepak Kakadia, Jin Yang, Alexander Gilgur, 2017-09-27 This book is intended to describe how to leverage emerging technologies big data analytics and SDN to address challenges specific to LTE and IP network performance and fault management data in order to more efficiently manage and operate an LTE wireless networks The

proposed integrated solutions permit the LTE network service provider to operate entire integrated network from RAN to Core from UE to application service as one unified system and correspondingly collect and align disparate key metrics and data using an integrated and holistic approach to network analysis. The LTE wireless network performance and fault involves the network performance and management of network elements in EUTRAN, EPC and IP transport components not only as individual components but also as nuances of inter working of these components. The key metrics for EUTRAN include radio access network accessibility, retainability, integrity, availability and mobility. The key metrics for EPC include MME accessibility, mobility and capacity, SGW, PGW capacity and connectivity. In the first parts of the book the authors describe fundamental analytics techniques and various key network partitions: RAN, Backhaul, Metro and Core of a typical LTE Wireless Service Provider Network. The second part of the book develops more advanced analytic techniques that can be used to solve complex wireless network problems. The second part of this book also describes practical and novel solutions for LTE service network performance and fault management systems using big data engineering. Self organizing network SON architecture is presented as a way to utilize network performance and fault analytics to enable network automation. SON can significantly improve operational efficiencies and speed up network deployment. This book provides various ways to leverage data science to more intelligently and reliably to automate and manage a wireless network. The contents of the book should be useful to professional engineers and networking experts involved in LTE network operations and management. The content will also be of interest to researchers, academic and corporate interested in the developments in fault analytics in LTE networks.

Demonstration of an Effective 4G LTE Network Simulator to Analyze Performance and Ensure Reliable Communication Naveen Narasimhaiah, 2015. With the growing population, technology is growing without any bounds. With these advancements we have reached a footing where we cannot imagine the world without communications. This dependability on communications strikes a need for highly reliable and cost effective communication technology from the perspective of the user as well as the service provider. Though the 3GPP's Long Term Evolution (LTE) has been successful to mitigate most of the challenges, there arises a need to foresee the cellular network evolution considering various factors like increase in number of users in a particular area, urbanization etc and accordingly use the features of LTE to overcome the effects of them before actually deploying the network in the real world. This thesis outlines the requirement for an effective 4G LTE simulator that can model the real world cellular network by considering the various effects on a wireless network like fading, pathloss, number of users and resource allocation. It can then explore various aspects of 4G LTE that contributes towards design and analysis of the network performance for various scenarios supporting deployment of the new network for futuristic operation or optimizing the existing network. In this study we closely look through a System level LTE Simulator developed by the Institute of Telecommunications of The Vienna University of Technology Austria. Using this simulator we study different scheduling schemes to evaluate performance and demonstrate how important the role of scheduling scheme

is to overcome network congestion We study various features of LTE that help in increasing throughput for various traffic models over a network and demonstrate the role of small cells in increasing the overall throughput of the network by comparing with the existing macro cell network Various parameters are varied and results are obtained for various scenarios using the Vienna LTE simulator These results are then used to demonstrate how Quality of Service QoS capacity planning and resource management are achieved through LTE technology This study helps the service provider to offer reliable service at lower implementation cost and deploy a network that has ability to sustain the evolution *Future Mobile Communications* Yasir Zaki,2012-11-29 The key to a successful future mobile communication system lies in the design of its radio scheduler One of the key challenges of the radio scheduler is how to provide the right balance between Quality of Service QoS guarantees and the overall system performance Yasir Zaki proposes innovative solutions for the design of the Long Term Evolution LTE radio scheduler and presents several LTE radio scheduler analytical models that can be used as efficient tools for radio dimensioning The author also introduces a novel wireless network virtualization framework and highlights the potential gains of using this framework for the future network operators This framework enables the operators to share their resources and reduce their cost thus achieving a better overall system performance and radio resource utilization

Handover Optimisation Using Neural Networks Within LTE Neil Sinclair,2013 Mobile communication infrastructures are getting more complex with the addition of femtocells into the network architecture Allied with this the increased use of smart phones add strain onto the network because of higher data requirements Femtocells are a useful resource to reduce the demand on the macrocell layer and effective handover management is needed to transfer services to and from each base station The importance of handover management is high within LTE and is included within a use case of Self Organizing Networks Base stations can autonomously decide whether handover should take place and assign the values of relevant parameters Setting relevant parameters effectively requires more delicate attention with femtocells to allow for effective and seamless handover to the macrocell Novel approaches with small amounts of additional signal processing can be utilised to improve handover efficiency In this thesis variations of Self Organising Maps have been implemented Self Organising Maps can be used to learn the locations of the indoor environment from where handover requests have occurred and based on previous experience decide whether to permit or prohibit these handovers Once the neural network has adapted to the indoor environment handover can be optimised in different regions independently while still permitting necessary handover The results of the investigations described within this thesis show that utilising location within the handover process is an effective way to improve handover performance within an indoor environment using an LTE femtocell

LTE Handover Performance Evaluation Based on Power Budget Handover Algorithm José Bruno Iñiguez Chavarría,2014 LTE Long Term Evolution is a fourth generation cellular network technology that provides improved performance related to data rate coverage and capacity compared to legacy cellular systems In this context one of the main goals of LTE is to

provide fast and seamless handover from one cell to another to meet a strict delay requirement while simultaneously keeping network management simple Hence the decision to trigger a handover is a crucial component in the design process of handover since the success and the efficiency to a large extent depends on the accuracy and timeliness of the decision The design of an efficient and successful handover requires a careful selection of HO parameters and the optimal setting of these The LTE standard supports two parameters to trigger the handover and select the target cell hysteresis margin and Time to Trigger TTT The research topic of this thesis which is LTE Handover Performance Evaluation Based on Power Budget Handover Algorithm focuses on different combinations or settings of HOM and TTT values to evaluate the handover performance based on Reference Signal Received Power RSRP measurement within certain deployment scenarios such as different UE speeds system loads and cell sizes The Power Budget Handover Algorithm PBHA picks the best hysteresis and time to trigger combinations to evaluate the system performance in terms of number of handovers signal to interference plus noise ratio SINR throughput delay and packet lost for UE s which are about to perform the handover

Algorithm to Achieve Optimized Handover Margin in LTE System Venkatesh G. K.,Rao P. V.,Govardhan N.,2015-09-09 Long Term Evolution is a wireless communication system to achieve high network capacity and high spectral efficiency Prediction of handover and deciding of handover in long term evolution systems is very complicated task Altering the parameters in order to achieve less delay in the handover then it has to be compromised with the system performance and user experience Handover parameters are manually set to obtain the better system performance by doing it will consume more time Due to increased cell number in Long Term Evolution systems the services are provided with higher speed With the increase in cell number the operating expenditure for managing them also increases Solution for resolving this problem is by making use of self configuring and self optimizing method From these two techniques self optimization is well known for reducing operating expenditure The handover optimization techniques are analyzed for the stationary mobility users in the conventional method The main intention of our project is to obtain better handover performance
