1. Charles Darwin observed variations in the characteristics of animals and plants on the different islands of the Galapagos.
2. In addition to observing living organisms, Darwin studied the preserved remains of ancient organisms called fossils.
3. The following idea proposed by Lamarck was later found to be incorrect: acquired characteristics can be inherited.
4. Differences among individuals of a species are referred to as Natural variation.
5. An animal breeder would use artificial selection.
6. An inherited characteristic that increases an organism's ability to survive and reproduce in its specific environment is called adaptation.
7. The concept that each living species has descended, with changes, from other species over time is referred to as descent with modification.
8. Fitness is a result of adaptations.
9. Structures that have different mature forms but develop from the same embryonic tissue are vestigial organs; homologous structures are structures that have different mature forms but develop from the same embryonic tissue.
10. The economist who reasoned that if the human population continued to grow unchecked, eventually there would not be enough resources was Malthus.
11. Evolution is the process by which populations of organisms change over generations through the selection of advantageous traits, such as the development of antibiotic resistance in bacteria.
12. Darwin observed variations in physical traits, unique characteristics adapted to isolated island habitats, and a pattern of gradual change and adaptation to environments in animals in South America and on the Galapagos Islands.
13. Darwin's visit to the Galapagos Islands greatly influenced his thoughts on evolution, as he observed the unique characteristics and adaptations of species on the islands, as well as the variations in physical traits among similar species, leading him to formulate his theory of evolution through natural selection based on this concrete evidence.
14. Hutton and Lyell's belief in uniformitarianism, the idea that geological processes have acted continuously and uniformly over long periods of time, contrasted with the prevailing belief in catastrophism, shaping the modern understanding of Earth's geological history.
15. Lamarck's principle of use and disuse posits that organisms can develop new traits or modify existing ones based on their interactions with the environment, with acquired characteristics believed to be inheritable by offspring.
16. Natural variation provides the genetic diversity needed for natural selection to act upon, allowing individuals with advantageous traits a better chance of survival and reproduction, thus driving the process of evolution.
