## Dunnett's Test

Used for comparing multiple treatment groups to a single control group. It's ideal for experiments where the focus is on how treatments differ from the control group specifically.

## Bonferroni Correction

A conservative approach that divides the alpha value by the number of comparisons. It reduces the risk of type I errors but may increase the likelihood of type II errors.

## Newman-Keuls Test

A sequential test for pairwise comparisons, used to control the error rate. It's less conservative than Bonferroni but more prone to type I errors in some situations.

## Scheffé Test

A flexible test, effective for unequal group sizes. It compares all possible contrasts between group means, offering robust control of type I errors, though it may be less powerful.
