## Stepper Motor Basics

A stepper motor is an electromechanical device which converts electrical pulses into discrete mechanical movements. The shaft or spindle of a stepper motor rotates in discrete step increments when electrical command pulses are applied to it in the proper sequence. The motor's rotation has several direct relationships to these applied input pulses. The sequence of the applied pulses is directly related to the direction of motor shafts rotation. The speed of the motor shafts rotation is directly related to the frequency of the input pulses and the length of rotation is directly related to the number of input pulses applied.

### Stepper Motor Advantages and Disadvantages

#### Advantages

1. The rotation angle of the motor is proportional to the input pulse.
2. The motor has full torque at standstill (if the windings are energized)
3. Precise positioning and repeatability of movement since good stepper motors have an accuracy of 3 – 5% of a step and this error is non-cumulative from one step to the next.
4. Excellent response to starting/stopping/reversing.
5. Very reliable since there are no contact brushes in the motor. Therefore the life of the motor is simply dependant on the life of the bearing.
6. The motor's response to digital input pulses provides open-loop control, making the motor simpler and less costly to control.
7. It is possible to achieve very low speed synchronous rotation with a load that is directly coupled to the shaft.
8. A wide range of rotational speeds can be realized as the speed is proportional to the frequency of the input pulses.

#### Disadvantages

1. Resonances can occur if not properly controlled.
2. Not easy to operate at extremely high speeds.

### Open Loop Operation

One of the most significant advantages of a stepper motor is its ability to be accurately controlled in an open loop system. Open loop control means no feedback information about position is needed. This type of control eliminates the need for expensive sensing and feedback devices such as optical encoders. Your position is known simply by keeping track of the input step pulses.

### Stepper Motor Types

There are three basic stepper motor types. They are :

- Variable-reluctance
- Permanent-magnet
- Hybrid

#### Variable-reluctance (VR)

This type of stepper motor has been around for a long time. It is probably the easiest to understand from a structural point of view. Figure 1 shows a cross section of a typical V.R. stepper motor. This type of motor consists of a soft iron multi-toothed rotor and a wound stator. When the stator windings are energized with DC current the poles become magnetized. Rotation occurs when the rotor teeth are attracted to the energized stator poles.

#### Permanent Magnet (PM)

Often referred to as a "tin-can" or "canstock" motor the permanent magnet step motor is a low cost and low resolution type motor with typical step angles of 7.5° to 15°. (48 – 24 steps/revolution) PM motors as the

A Study of the Technical Feasibility of Developing a Standardized Energy Control System Specifically for Army Facilities Dominic Eng, K. H. Wu, 1977 This report evaluates the feasibility of developing a standardized energy control system ECS for monitoring and controlling energy use in Army buildings and facilities Criteria used in the evaluation were that the system must Maximize use of off the shelf hardware Use standard software programs and language Use hardware and software modules which can be easily changed or expanded to insure the user maximum independence of the original equipment manufacturer Provide reliable real time facility monitoring and control functions for all types of equipment systems Minimize number of personnel and skills required for operation Maintain cost effectiveness and Be easy to operate Results of the evaluation show that a standardized Army system for energy conservation is feasible and would be cost effective Available hardware can be used but further development is needed to prepare necessary standardized software The

proposed standardized ECS consists of 1 microprocessor based remote terminals for optimum fail safe operations strategically located throughout the installation and capable of monitoring and controlling real time processes and 2 a centrally located minicomputer based console for supervisory energy control activities and data logging The proposed system would be capable of efficient system modification and expansion and provide good system reliability *Motorola Linear Interface Integrated Circuits* Motorola Semiconductor Products Inc.
