*Single Piles in Liquefiable Ground* Rui Wang,2016-03-17 This thesis focuses on the seismic response of piles in liquefiable ground It describes the design of a three dimensional unified plasticity model for large post liquefaction shear deformation of sand formulated and implemented for parallel computing It also presents a three dimensional dynamic finite element analysis method for piles in liquefiable ground developed on the basis of this model Employing a combination of case analysis centrifuge shaking table experiments and numerical simulations using the proposed methods it demonstrates the seismic response patterns of single piles in liquefiable ground These include basic force resistance mode kinematic and inertial interaction coupling mechanism and major influence factors It also discusses a beam on the nonlinear Winkler foundation BNWF solution and a modified neutral plane solution developed and validated using centrifuge experiments for piles in consolidating and reconsolidating ground Lastly it studies axial pile force and settlement during post earthquake reconsolidation showing pile axial force to be irrelevant in the reconsolidation process while settlement is process dependent
