

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the sliding, the rotation of the shafts in a bearing to allow movement. These consist of 2 gaskets which distribute axial forces in a gasket with an application on all shafts and shaft components used to secure the gasket. A gasket is used to maintain the pressure in a system and to stop it from leaking throughout the life cycle application. The gasket compresses the two components between the mating surfaces of the system. This is done by creating a radial force to compress the gasket against the two components between the mating surfaces. If the gasket creates resistance to the axial and rotational through the life of the application then it would be secured for a gasket.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a certain seal. Every gasket application or design has their own unique challenges that must be addressed by ensuring the performance of what the gasket is required to do against the application.
