language is not named after Eddie Haskell the sneaky double dealing neighbor kid in the ancient TV sitcom Leave It To Beaver Haskell is named after Haskell Brooks Curry an American mathematician and logician If you don t know logicians create models to describe and define human reasoning for example problems in mathematics computer science and philosophy Haskell s main work was in combinatory logic a notation designed to eliminate the need for variables in mathematical logic Combinatory logic captures many key features of computation and as a result is useful in computer science Haskell has three programming languages named after him Haskell Brooks and Curry Haskell the language is built around functions useful blocks of code that do specific tasks They are called and used only when needed Another interesting feature of functional languages like Haskell functions are treated as values like integers numbers and strings You can add a function to another function the way you can add an integer to an integer 1 + 1 or 35 + 53 Perhaps the best way to describe this quality is a spreadsheet in a cell in the spreadsheet you can add numbers as well as a combination of functions to work on numbers For example you might specify each number in cells 1 + 10 be added up as a sum In Excel at least you also can use SUMIF to look for a pattern in cells 1 + 10 and if the pattern is found perform an action on any cells with the pattern What Makes Haskell Special Technically Haskell is a general purpose functional programming language with non strict semantics and strong static typing The primary control construct is the function Say that fast ten times Here s what it means Every language has a strategy to evaluate when to process the input arguments used in a call to a function The simplest strategy is to evaluate the input arguments passed then run the function with the arguments Non strict semantics means the input arguments are not evaluated unless the arguments passed into the function are used to evaluate what is in the body of the function Programming languages have rules to assign properties called a type to the components of the language variables functions expressions and modules A type is a general description of possible values the variable function expression or module can store Typing helps minimize bugs for example when a calculation uses a string house or cat instead of a number 2 or 3 Strong static typing evaluates the code before runtime when the code is static and possibly as code is written The order in which statements instructions and functions are evaluated and executed determines the results of any piece of code Control constructs define the order of evaluation Constructs use an initial keyword to flag the type of control structure used Initial keywords might be if or do or loop while final keywords might be end if or enddo or end loop Instead of a final keyword Haskell uses indentation level tabs or curly brackets or a mix to indicate the end of a control structure Perhaps what makes Haskell special is how coders have to think when they use the language Functional programming languages work in very different ways than imperative languages where the coder manages many low level details of what happens in their code and when While it is true all languages have things in common it s also true languages are mostly functional or mostly imperative the way people are mostly right handed or left handed Except functional programming languages require a different way of thinking about software as you code
