Encyclopedia of Food Science and Technology ,2000 Estimators for Uncertain Dynamic Systems A.I. Matasov, 1999-01-31 When solving the control and design problems in aerospace and naval engineering energetics economics biology etc we need to know the state of investigated dynamic processes The presence of inherent uncertainties in the description of these processes and of noises in measurement devices leads to the necessity to construct the estimators for corresponding dynamic systems The estimators recover the required information about system state from measurement data An attempt to solve the estimation problems in an optimal way results in the formulation of different variational problems The type and complexity of these variational problems depend on the process model the model of uncertainties and the estimation performance criterion A solution of variational problem determines an optimal estimator However there exist at least two reasons why we use nonoptimal estimators The first reason is that the numerical algorithms for solving the corresponding variational problems can be very difficult for numerical implementation For example the dimension of these algorithms can be very high **Optimization Methods in Operations Research and Systems Analysis** K.
