Dynamical Systems In Population Biology:

Dynamical Systems in Population Biology Xiao-Qiang Zhao, 2013-06-05 Population dynamics is an important subject in mathematical biology. A central problem is to study the long term behavior of modeling systems. Most of these systems are governed by various evolutionary equations such as difference, ordinary functional and partial differential equations (see e.g. [165, 142, 218, 119, 55]). As we know, interactive populations often live in a fluctuating environment. For example, physical environmental conditions such as temperature and humidity and the availability of food, water and other resources usually vary in time with seasonal or daily variations. Therefore, more realistic models should be nonautonomous systems. In particular, if the data in a model are periodic functions of time with commensurate period, a periodic system arises. If these periodic functions have different minimal periods, we get an almost periodic system. The existing reference books from the dynamical systems point of view mainly focus on autonomous biological systems. The book of Hess [106] is an excellent reference for periodic parabolic boundary value problems with applications to population dynamics. Since the publication of this book, there have been extensive investigations on periodic, asymptotically periodic, almost periodic and even general nonautonomous biological systems, which in turn have motivated further development of the theory of dynamical systems. In order to explain the dynamical systems approach to periodic population problems, let us consider as an illustration two species periodic competitive systems $\frac{dU_i}{dt} = U_i(U_2 - U_1)$ (0 < U_1 < U_2 < 0). *Dynamical Systems in Population Biology* Xiao-Qiang Zhao, 2017-04-11 This research monograph provides an introduction to the theory of nonautonomous semiflows with applications to population dynamics. It develops dynamical system approaches to various evolutionary equations such as difference, ordinary functional and partial differential equations and pays more attention to periodic and almost periodic phenomena. The presentation includes persistence theory, monotone dynamics, periodic and almost periodic semiflows, basic reproduction ratios, traveling waves and global analysis of prototypical population models in ecology and epidemiology. Research mathematicians working with nonlinear dynamics, particularly those interested in applications to biology, will find this book useful. It may also be used as a textbook or as supplementary reading for a graduate special topics course on the theory and applications of dynamical systems. Dr. Xiao-Qiang Zhao is a University Research Professor at Memorial University of Newfoundland, Canada. His main research interests involve applied dynamical systems, nonlinear differential equations and mathematical biology. He is the author of more than 100 papers and his research has played an important role in the development of the theory and applications of monotone dynamical systems, periodic and almost periodic semiflows, uniform persistence and basic reproduction ratios. [Dynamical Systems and Population Persistence](#) Hal L. Smith, Horst R. Thieme, 2011 The mathematical theory of persistence answers questions such as which species in a mathematical model of interacting species will survive over the long term. It applies to infinite dimensional as well as to finite dimensional dynamical systems and to discrete time as well as to continuous time semiflows. This monograph provides a self-contained treatment of persistence theory that is

accessible to graduate students The key results for deterministic autonomous systems are proved in full detail such as the acyclicity theorem and the tripartition of a global compact attractor Suitable conditions are given for persistence to imply strong persistence even for nonautonomous semiflows and time heterogeneous persistence results are developed using so called average Lyapunov functions Applications play a large role in the monograph from the beginning These include ODE models such as an SEIRS infectious disease in a meta population and discrete time nonlinear matrix models of demographic dynamics Entire chapters are devoted to infinite dimensional examples including an SI epidemic model with variable infectivity microbial growth in a tubular bioreactor and an age structured model of cells growing in a chemostat Publisher's description

Population Dynamics: Algebraic And Probabilistic

Approach Utkir A Rozikov, 2020-04-22 A population is a summation of all the organisms of the same group or species which live in a particular geographical area and have the capability of interbreeding. The main mathematical problem for a given population is to carefully examine the evolution time dependent dynamics of the population. The mathematical methods used in the study of this problem are based on probability theory, stochastic processes, dynamical systems, nonlinear differential and difference equations, and non associative algebras. A state of a population is a distribution of probabilities of the different types of organisms in every generation. Type partition is called differentiation, for example sex differentiation which defines a bisexual population. This book systematically describes the recently developed theory of bisexual population and mainly contains results obtained since 2010. The book presents algebraic and probabilistic approaches in the theory of population dynamics. It also includes several dynamical systems of biological models such as dynamics generated by Markov processes of cubic stochastic matrices, dynamics of sex linked population, dynamical systems generated by a gonosomal evolution operator, dynamical system and an evolution algebra of mosquito population and ocean ecosystems. The main aim of this book is to facilitate the reader's in depth understanding by giving a systematic review of the theory of population dynamics which has wide applications in biology, mathematics, medicine and physics.

Dynamical Systems Lamberto Cesari, Jack K. Hale, Joseph P. LaSalle, 2014-05-10 **Dynamical Systems** An International Symposium Volume 1 contains the proceedings of the International Symposium on Dynamical Systems held at Brown University in Providence Rhode Island on August 12-16, 1974. The symposium provided a forum for reviewing the theory of dynamical systems in relation to ordinary and functional differential equations, as well as the influence of this approach and the techniques of ordinary differential equations on research concerning certain types of partial differential equations and evolutionary equations in general. Comprised of 29 chapters, this volume begins with an introduction to some aspects of the qualitative theory of differential equations, followed by a discussion on the Lefschetz fixed point formula. Nonlinear oscillations in the frame of alternative methods are then examined along with topology and nonlinear boundary value problems. Subsequent chapters focus on bifurcation theory, evolution governed by accretive operators, topological dynamics and its relation to integral equations and non autonomous systems, and non controllability of linear time invariant systems.

using multiple one dimensional linear delay feedbacks The book concludes with a description of sufficient conditions for a relaxed optimal control problem This monograph will be of interest to students and practitioners in the field of applied mathematics
