*Signal Processing and Optimisation of MIMO Radar* Luke Anthony Balzan, 2012 This thesis presents a background to and a series of interesting and novel results for a particular proposed model for narrowband MIMO radar systems The proposed model is both novel and unique comprising closely spaced antenna arrays that transmit orthogonally coded waveforms and can be seen as a logical extension to existing models for conventional single input single output radar systems Signal processing and optimisation is performed on the proposed system with a view to yield enhanced estimation and tracking performance The proposed signal and likelihood estimation models have been thoroughly defined with a number

of important approximations and simplifications to the models gained through the use and exploitation of orthogonally coded waveforms. All approximations and assumptions have been justified through the use of simulated examples. The Cramér-Rao bound for the models is derived and verified as correct through the use of simulated data. Through comparison of the Cramér-Rao bound to statistical estimation variances obtained through extensive simulations, the proposed models are shown to be efficient, thereby demonstrating the validity of the bound to be used as a performance metric for optimisation. With the knowledge that the proposed MIMO radar system is efficient, the Cramér-Rao bound is used as a measure for estimation performance optimisation. The bound is seen to be dependent on the choice of orthogonally coded waveforms used in the MIMO radar system, and by framing the selection of codes as a convex optimisation problem, codes can be chosen to minimise the Cramér-Rao bound, and since the system has been shown to be efficient, this also reduces estimate variance, thus improving the estimation performance of the system. This optimisation problem has been examined and simulated extensively with simulated data, substantiating the claims of performance improvement. Finally, this thesis explores the idea of tracking for MIMO radar. A Kalman filter-based tracker is proposed and simulated for the MIMO radar system. Extending the convex optimisation scheme discussed above, a similar optimisation problem is formed for the case of MIMO radar tracking. The optimisation problem has been simulated to select orthogonal codes for transmitting based on the predicted target motion obtained from the Kalman filter tracker. By basing the optimisation on the predicted tracker outputs, an action perception cycle for MIMO radar is established where the system is able to adapt to its surroundings based on its current and predicted view of the environment. Simulations have been used to observe the performance improvements of implementing the optimisation scheme, and thereby showing the action perception cycle for MIMO radar at work. *Index to IEEE Publications* Institute of Electrical and Electronics Engineers, 1996. **Signal Processing Algorithms for MIMO Radar** Chun-Yang Chen, P. **Evaluation of Coding Scheme for MIMO Radar** Suresh Kumar Harikrishnan, 2005. Multiple Input Multiple Output MIMO antenna systems have shown a great potential for wireless communication. These systems support high capacity, increased diversity, and interference suppression. Recently, it has been proposed that MIMO constellations for Radar MIMO Radar is not only a new research field but also a very promising approach in terms of overcoming Radar Cross Section (RCS) fluctuations with diversity. This thesis explores the potential of coding schemes for MIMO Radar. The ambiguity functions, measures related to MIMO Radar, are used to evaluate how much diversity gain can be coherently achieved with certain coding schemes. The results of this analysis show that the cross-correlation between the signals from different transmitters hinders achieving the full diversity gain. The code length of the used Gold codes is an important factor for this effect. However, in this thesis, a coding scheme related to the Alamouti scheme in Communication is presented. This scheme, under some constraints, is capable of maintaining orthogonality between the signals from different transmitters and therefore cancels the

mutual interference among those signals In general MIMO radar is a novel and ingenious approach to improve radar performance which needs to be analyzed and developed This thesis is the first work exploring the coding schemes and the related aspects for MIMO Radar

**MIMO Radar Processing Methods for Anticipating and Preventing Real World Imperfections** Mathieu Cattenoz, 2015 The MIMO radar concept promises numerous advantages compared to today's radar architectures flexibility for the transmitting beam pattern design including wide scene illumination and fine resolution after processing and system complexity reduction through the use of less antennas and the possibility to transfer system control and calibration to the digital domain However the MIMO radar is still at the stage of theoretical concept with insufficient consideration for the impacts of waveforms lack of orthogonality and system hardware imperfections The ambition of this thesis is to contribute to paving the way to the operational MIMO radar In this perspective this thesis work consists in anticipating and compensating the imperfections of the real world with processing techniques The first part deals with MIMO waveform design and we show that phase code waveforms are optimal in terms of spatial resolution We also exhibit their limits in terms of sidelobes appearance at matched filter output The second part consists in taking on the waveform intrinsic imperfections and proposing data dependent processing schemes for the rejection of the induced residual sidelobes We develop an extension for the Orthogonal Matching Pursuit OMP that satisfies operational requirements especially localization error robustness low computation complexity and nonnecessity of training data The third part deals with processing robustness to signal model mismatch especially how it can be prevented or anticipated to avoid performance degradation In particular we propose a digital method of transmitter phase calibration The last part consists in carrying out experiments in real conditions with the Hycam MIMO radar testbed We exhibit that some unanticipated encountered distortions even when limited at the matched filter output can greatly impact the performance in detection of the data dependent processing methods
