Strut And Tie Modeling In Reinforced Concrete Structures:

Design Examples for Strut-and-tie Models fib Fédération internationale du béton, 2011 fib Bulletin 61 is a continuation of fib Bulletin 16 2002 Again the bulletin's main objective is to demonstrate the application of the FIP Recommendations Practical Design of Structural Concrete and especially to illustrate the use of strut and tie models to design discontinuity regions D regions in concrete structures Bulletin 61 presents 14 examples most of which are existing structures built in recent years Although some of the presented structures can be considered to be quite important and in some instances complex the chosen examples are not intended to be exceptional The main aim is to look at specific design aspects by selecting D regions of the presented structures that are designed and detailed according to the proposed design principles and specifications for the use of strut and tie models Two papers at the end of the bulletin deal with the role of concrete tension fields in modelling with strut and tie models and summarize the experiences gained by the Working Group in applying strut and tie models to the examples in the bulletin It is hoped that fib Bulletin 61 will be of interest to engineers involved in the design of concrete structures supporting the use of more consistent design and detailing tools such as strut and tie models

A Comparison of Design Using Strut-and-tie Modeling and Deep Beam Method for Transfer Girders in Building Structures Eric Skibbe, 2010 Strut and Tie models are useful in designing reinforced concrete structures with discontinuity regions where linear stress distribution is not valid Deep beams are typically short girders with a large point load or multiple point loads These point loads in conjunction with the depth and length of the members contribute to a member with primarily discontinuity regions ACI 318 08 Building Code Requirements for Structural Concrete provides a method for designing deep beams using either Strut and Tie models STM or Deep Beam Method DBM This report compares dimension requirements concrete quantities steel quantities and constructability of the two methods through the design of three different deep beams The three designs consider the same single span deep beam with varying height and loading patterns The first design is a single span deep beam with a large point load at the center girder The second design is the deep beam with the same large point load at a quarter point of the girder The last design is the deep beam with half the load at the midpoint and the other half at the quarter point These three designs allow consideration of different shear and STM model geometry and design considerations Comparing the two different designs shows the shear or cracking control reinforcement reduces by an average 13% because the STM considers the extra shear capacity through arching action The tension steel used for either flexure or the tension tie increases by an average of 16% from deep beam in STM design This is due to STM taking shear force through tension in the tension reinforcement through arching action The main advantage of the STM is the ability to decrease member depth without decreasing shear reinforcement spacing If the member depth is not a concern in the design the preferred method is DBM unless the designer is familiar with STMs due to the similarity of deep beam and regular beam design theory

Structural Concrete Salah El-Metwally, Wai-Fah Chen, 2017-10-02 This book

examines the application of strut and tie models STM for the design of structural concrete It presents state of the art information from fundamental theories to practical engineering applications and also provides innovative solutions for many design problems that are not otherwise achievable using the traditional methods

Performance-Based Optimization of Structures Qing Quan Liang,2005-02-25 Performance Based Optimization of Structures introduces a method to bridge the gap between structural optimization theory and its practical application to structural engineering The Performance Based Optimization PBO method combines modern structural optimisation theory with performance based design concepts to produce a powerful technique for use in structural design This book provides the latest PBO techniques for achieving optimal topologies and shapes of continuum structures with stress displacement and mean compliance constraints The emphasis is strongly placed on practical applications of automated PBO techniques to the strut and tie modelling of structural concrete which includes reinforced and prestressed concrete structures Basic concepts underlying the development of strut and tie models design optimization procedure and detailing of structural concrete are described in detail Alternative approaches to topology optimization are also introduced The book contains numerous practical design examples illustrating the nature of the load transfer mechanism of structures
