The test is 'closed book,' but if you wish you may bring a one-sided sheet of formulas. The intent of this sheet is as a reminder of important formulas and definitions, and as a compact transcription of the answers provided here. If this privilege is abused, it will be revoked for future tests. The test will be composed entirely from a subset of the following problems, as well as those in problem sets 3 and 4. Thus if you are familiar and comfortable with these problems, there will be no surprises!

1. *Scaling in fluids:* Near the liquid-gas critical point, the free energy is assumed to take the scaling form $f/N = t^{2-\alpha} g(\delta\rho/t^\beta)$, where $t = |T - T_c|/T_c$ is the reduced temperature, and $\delta\rho = \rho - \rho_c$ measures deviations from the critical point density. The leading singular behavior of any thermodynamic parameter $Q(t, \delta\rho)$ is of the form t^{ν_Q} on approaching the critical point along the isochore $\rho = \rho_c$; or $\delta\rho^\beta$ for a path along the isotherm $T = T_c$. Find the exponents ν_Q and β for the following quantities:

- Any homogeneous thermodynamic quantity $Q(t, \delta\rho)$ can be written in the scaling form

$$Q(t, \delta\rho) = t^{\nu_Q} g_Q\left(\frac{\delta\rho}{t^\beta}\right).$$

Thus, the leading singular behavior of Q is of the form t^{ν_Q} if $\delta\rho = 0$, i.e. along the critical isochore. In order for Q to be independent of $\delta\rho$ along the critical isotherm $t = 0$, the scaling function for a large enough argument should be of the form

$$\lim_{x \rightarrow \infty} g_Q(x) = x^{-\nu_Q/\beta},$$

so that

$$Q(0, \delta\rho) \propto (\delta\rho)^{\nu_Q}, \quad \text{with} \quad \nu_Q = \frac{\nu_Q}{\beta}.$$

(a) The internal energy per particle U/N , and the entropy per particle S/N .

- Let us assume that the free energy per particle is

$$f = \frac{F}{N} = t^{2-\alpha} g\left(\frac{\delta\rho}{t^\beta}\right),$$

and that $T < T_c$, so that $\frac{\partial f}{\partial T} = -\frac{1}{T} \frac{\partial f}{\partial t}$. The entropy is then given by

$$s = -\left.\frac{\partial f}{\partial T}\right|_V = \frac{1}{T_c} \left.\frac{\partial f}{\partial t}\right|_\rho = \frac{t^{1-\alpha}}{T_c} g_s\left(\frac{\delta\rho}{t^\beta}\right),$$

Introduction To Statistical Mechanics John Dirk Walecka, 2011-08-12 The science of statistical mechanics is concerned with defining the thermodynamic properties of a macroscopic sample in terms of the properties of the microscopic systems of which it is composed The aim of this book is to provide a clear logical and self contained treatment of equilibrium statistical mechanics starting from Boltzmann's two statistical assumptions and to present a wide variety of applications to diverse physical assemblies The coverage is enhanced and extended through an extensive set of accessible problems An appendix provides an introduction to non equilibrium statistical mechanics through the Boltzmann equation and its extensions The book assumes introductory courses in classical and quantum mechanics as well as familiarity with multi variable calculus and the essentials of complex analysis Some knowledge of thermodynamics is assumed although the book starts with an appropriate review of that topic The targeted audience is first year graduate students and advanced undergraduates in physics chemistry and the related physical sciences The goal of this text is to help the reader obtain a clear working knowledge of the very useful and powerful methods of equilibrium statistical mechanics and to enhance the understanding and appreciation of the more advanced texts

Introduction To Statistical Mechanics: Solutions To Problems John Dirk Walecka, 2016-08-25 Statistical mechanics is concerned with defining the thermodynamic properties of a macroscopic sample in terms of the properties of the microscopic systems of which it is composed The previous book *Introduction to Statistical Mechanics* provided a clear logical and self contained treatment of equilibrium statistical mechanics starting from Boltzmann's two statistical assumptions and presented a wide variety of applications to diverse physical assemblies An appendix provided an introduction to non equilibrium statistical mechanics through the Boltzmann equation and its extensions The coverage in that book was enhanced and extended through the inclusion of many accessible problems The current book provides solutions to those problems These texts assume only introductory courses in classical and quantum mechanics as

well as familiarity with multi variable calculus and the essentials of complex analysis Some knowledge of thermodynamics is also assumed although the analysis starts with an appropriate review of that topic The targeted audience is first year graduate students and advanced undergraduates in physics chemistry and the related physical sciences The goal of these texts is to help the reader obtain a clear working knowledge of the very useful and powerful methods of equilibrium statistical mechanics and to enhance the understanding and appreciation of the more advanced texts
